Appendices

Acronyms

AFDE	Aecon, Flatiron, Dragados, and EBC
ARD/ML	acid rock drainage/metal leaching (or leachate)
CEMP	construction environmental management plan
DIC	diversion inlet cofferdam
DOC	diversion outlet cofferdam
DTIP	diversion tunnel inlet portal
DTOP	diversion tunnel outlet portal
EAC	Environmental Assessment Certificate
EPP	environmental protection plan
GSS	generating station and spillways
IDZ	initial dilution zone
IEM	Independent Environmental Monitor
LBDT	left bank drainage tunnel
LBex	left bank excavation
LC50	lethal concentration 50
MCW	main civil works
MWTF	mobile water treatment facility
Non-PAG/NPAG	non-potentially acid generating
PAG	potentially acid generating
PRHP	Peace River Hydro Partners
RBDT	right bank drainage tunnel
RCC	roller compacted concrete
RSEM	relocated surplus excavated materials (area)
SBIAR	south bank initial access road
TPSA	temporary PAG storage area/facility
TSS	total suspended solids
QP	Qualified Professional

1. Acid Rock Drainage and Metal Leachate Management Plan

The Acid Rock Drainage and Metal Leachate Monitoring Plan has been developed in accordance with the following regulatory conditions:

1. Condition 7 of the Site C Project's Federal Decision Statement, issued to BC Hydro on October 14, 2014 and re-issued November 25, 2014, which requires BC Hydro to:

   "*…develop, in consultation with Environment Canada and Natural Resources Canada, a water quality management plan to address environmental effects to the aquatic environment from the Designated Project, including acid rock drainage and metal leaching."*

2. Condition 3 of the Site C Project's Environmental Assessment Certificate, (EAC #E14-02), issued to BC Hydro on October 14, 2014, which requires BC Hydro to:

   "*…develop a water quality monitoring program, [which] must be detailed in the Acid Rock Drainage and Metal Leachate Management Plan."*

The Site C Project's Construction Environmental Management Plan (CEMP; Revision 6 - July 15, 2019), Appendix E – Acid Rock Drainage and Metal Leachate Management Plan fulfills the requirements of the water quality management plan referenced in the above conditions.

This update satisfies the annual reporting requirements specified by these conditions, covering the reporting period from January 1 to December 31, 2019.

2. Overview of Site Activities in 2019

2.1 General Description of Site Activities

Major construction activities conducted as part of the Site C Clean Energy Project in 2019 involving ground disturbance included earthworks in preparation for the dam site foundations, construction of additional relocated surplus excavated materials (RSEM) management facilities, off-site quarry operations, construction of the 85th avenue conveyor, and construction of water conveyance and containment structures.

The water quality monitoring programs that have been implemented on site by BC Hydro and their contractors have been developed to fulfill requirements of the CEMP within the RSEM facilities, water conveyance structures, and within the Peace River.

Bedrock material (including weathered bedrock and colluvium) underlying the Dam Site is characterized to be potentially acid generating (PAG). Environmental management protocols are implemented in all construction areas by BC Hydro to prevent or mitigate the development of acid rock drainage and metal leaching (ARD/ML) conditions. Overburden and soil materials are not potentially acid generating (Non-PAG) and are not managed the same as excavated PAG materials at the Dam Site. The primary PAG mitigation strategy employed at site is material management and the secondary strategy is water management.

Each construction area is required to have a BC Hydro approved environmental protection plan (EPP) which describes ARD/ML mitigation and management plans relevant to the site work as

per the CEMP Appendix E. A chance find procedure is included in the EPP document where exposure or disturbance of bedrock is not anticipated as part of the construction activities. As of December 31, 2019 (cumulatively since the start of project construction), 1,116 EPPs (including revisions) have been reviewed by BC Hydro. In the calendar year 2019, 222 EPPs (including revisions) were submitted to and reviewed by BC Hydro). Implementation of these plans is the responsibility of site contractors, and is overseen by BC Hydro, the Independent Environmental Monitor (IEM) and ARD/ML Qualified Professionals (QPs).

The location of construction areas and water management structures relevant to ARD/ML material management are described below and are shown on Figure 1. The areas are categorized per their location on the Right (south) Bank or Left (north) Bank of the Peace River, and are listed by excavation site, followed by either the temporary or permanent storage facility.

The water management system is continuously adapted as earthworks are undertaken and utilizes a series of temporary ponds and sumps. Ultimately, PAG contact water is diverted to one of 5 RSEM sediment ponds for discharge to the Peace River, or through the MWTF for treatment prior to discharge to an RSEM sediment pond. The active sediment ponds on site are as follows:

- RSEM R5a;
- RSEM R5b;
- RSEM R6;
- RSEM L5; and
- RSEM L6.

Dam site excavation of PAG bedrock totalled approximately 1,700,000 m^3 in 2019. The details of excavated materials from construction areas are detailed below. In total, approximately 900,000 m^3 of water was discharged from the sediment ponds to the Peace River in 2019.

2.2 Right Bank RSEMs

There are three catchment areas within the construction site on the Right Bank, including three RSEMs:

- RSEM Area R5a catchment and sediment pond area which includes the area where the majority of excavated PAG material will be deposited on the west side of the Moberly River;
- RSEM Area R5b catchment and sediment pond, which includes the Approach Channel and Area 23; and
- RSEM Area R6 catchment and sediment pond, which includes Area 20/21, Area A, the Right Bank Drainage Tunnel (RBDT), and Roller Compacted Concrete (RCC) Buttress Excavation.

Activities within each of these areas is further highlighted below.

2.2.1 RSEM R5a

Construction of the RSEM R5a facility commenced in December 2016 and it began receiving material in January 2017. The facility will be upstream from the dam and is permitted for permanent storage of up to approximately 9,300,000 m^3 of PAG material and 1,250,000 m^3 of NPAG material. Material resulting from excavation activities within the RCC Cofferdam Excavation and the Spillway Approach channel was transported into the facility. By the end of 2019, RSEM R5a contained a total volume of 5,298,254 m^3.

Surface water runoff from the RSEM Area R5a catchment drains to a series of four long sediment pond cells constructed adjacent to the perimeter dike. The eastern outflow channel for the non-contact intercept ditch upgradient of the RSEM area was completed in 2018; this discharges to the Moberly River south of the confluence with the Peace River. There has generally been little accumulation of surface water observed in the ponds in 2019, although a small amount of water discharged from these ponds in March 2019. The accumulation of water in the ponds was managed via trucking and pumping following this event to prevent future discharge events.

Monitoring of the bedrock geochemistry was completed by Lorax on behalf of PRHP (Appendix A). Monitoring of surface water quality is summarised in Section 3.2.1and 3.3.1. Monitoring of the groundwater quality at RSEM R5a is referenced below in Section 3.6.1.

Additional details of PAG management on the Left Bank are presented in Section 2.4.

2.2.2 RSEM R5b

The RSEM R5b facility was approved for PAG placement as of July 2016. Construction of the RSEM R5b facility was completed and began receiving PAG in early October 2016. The facility will be located upstream of the dam.

The RSEM storage capacity was reached by the end of 2016, and the facility received only approximately 3,500 m^3 in 2017, with total stored volume of approximately 357,000 m^3. No additional material was stored in this facility in 2018 or 2019. A compacted low permeability cover was previously installed to isolate the RSEM material from moisture and oxygen.

Surface water runoff from the ultimate footprint of the Approach Channel, Dam and Core Buttress, Area 32A/32B, and from the surface of the relatively small RSEM Area R5b are conveyed to the RSEM R5B sediment pond. Water from these aforementioned areas may be directed to the MWTF pre-treatment pond based on field observations, and once treated is released into the sludge/polishing pond which is then diverted to RSEM R5b.

Monitoring of the water in the RSEM R5b sediment pond is conducted by daily water quality sampling and through use of continuous data logger probes (pH, turbidity, temperature and conductivity) and instantaneous discharge flow meters.

The water quality monitoring with the RSEM R5b pond catchment is described by Lorax (Appendix A). Monitoring of the water in the RSEM R5b pond is referenced in Section 3.2.2 and 3.3.2. Monitoring of the groundwater quality at RSEM R5b is referenced below in Section 3.6.1.

2.2.3 RSEM R6

The RSEM R6 facility is not permitted for long term storage of PAG material and has only a small short-term storage area for stockpiling of surplus excavated bedrock material from RBDT development. Bedrock material placed in the facility is relocated to RSEM R5a.

The long term RSEM R6 sediment was constructed and completed in April 2017 and is permitted to receive some PAG contact water, into one of an eastern or western pond cell depending on water levels and water quality within each cell. Surface water runoff from the south (Area 20/21, SBIAR, and RBDT) and west (RCC Buttress Excavation) is conveyed to the RSEM Area R6 sediment ponds (east and west ponds). Water is pumped between the east and west ponds to provide additional retention time for particulate settling, when needed. Monitoring of the water in the RSEM R6 sediment pond is conducted by daily water quality sampling and

through use of continuous data logger probes (pH, turbidity, temperature and conductivity) and instantaneous discharge flow meters. The work was completed by Lorax (Appendix A) and is summarised in Section 3.2.3 and by Ecofish in Section 3.3.3.

2.3 Left Bank RSEMs

The Left Bank is divided into five main areas to describe water management:

- L5 catchment area and sediment pond, which includes the Left Bank Excavation (LBEX) area.
- Diversion Tunnel Inlet Portal (DTIP) and Diversion Tunnel Outlet Portal (DTOP) working areas, from which contact water is retained in storage tanks and generally transferred to the Mobile Water Treatment Facility (MWTF) on the Right Bank.
- Left Bank Cofferdam area which collects water in sumps, is treated for pH, and transferred to the RSEM L5 sediment pond.
- RSEM L6 catchment area and sediment pond.
- RSEM L3 in which NPAG material was placed.

2.3.1 RSEM L3

Water management and monitoring in the L3 catchment were undertaken by BC Hydro and its consultants, starting in early 2018 and continued throughout 2019. The RSEM L3 facility was constructed to contain Non-PAG surplus material from the LBEX and reached capacity (as per the original design) in mid-2016. L3 Creek channel was subsequently re-contoured to allow for drainage of the natural watercourse. L3 Creek drains into the Peace River approximately 1.5 km from RSEM L3. L4 Creek is a small tributary with naturally-occurring PAG contact water which flows into L3 Creek. This watercourse is not subject to ARD/ML monitoring requirements as no construction related activities have exposed bedrock or caused PAG contact water to flow into L3 Creek; however, BC Hydro is maintaining records of water quality within the drainage system as described by Tetra Tech (Appendix D).

2.3.2 RSEM L5 and RSEM L5 Extension

Construction of the RSEM L5 area commenced in late 2016 and began receiving bedrock material excavated from the Left Bank (Left Bank Drainage Tunnel, LBEX, and Left Bank Temporary Storage Area) at the end of June 2017. The RSEM L5 Extension started to receive PAG material from Left Bank excavation activities in 2019. At the end of 2019, RSEM Area L5 contained a total of 922,232 m^3 of PAG material, and the RSEM Area L5 Extension contained 385,843 m^3. These facilities will be upstream from the dam and are permitted for long term storage of PAG material. Construction of the Phase 1 of the long term RSEM ponds was complete at the end of 2018; this pond was approved for, and began discharging, water in Spring 2019.

No material was added to the L5 Garbage Creek stockpile in 2019; however, 24,120 m^3 of PAG material remains stockpiled and covered with NPAG at this location. Additional details of PAG management on the Left Bank are presented in Section 2.5.

The Garbage Creek diversion channel was constructed in late September 2016 and was operational for spring freshet of 2017, 2018, and 2019[1] to divert non-contact waters around RSEM L5 and into the Peace River via a lined channel. Diverted Garbage Creek water is

[1] The freshet period is somewhat variable but occurred from March through to mid-June in 2019 (similar to 2017, 2018) in the Peace River in the vicinity of the Site C dam construction.

impacted by natural bedrock exposures in upstream waters. The Garbage Creek diversion is located at the east end of RSEM Area L5. During freshet 2019, surface water runoff overtopped the diversion and accumulated in RSEM Area L5. This water was pumped into the lower diversion channel and flowed out to the Peace River. Construction activities were completed in 2019 in order to reconfigure the Garbage Creek head pond and diversion channel in order to accommodate future freshet surge flows.

Description of bedrock material geochemical monitoring and water quality monitoring within the RSEM L5 facility is included in the Lorax Annual Report (Appendix A).

2.3.3 RSEM L6

The RSEM Area L6 starter dyke and sediment pond were completed in December 2018. A total of 62,200 m^3 of PAG is now stored in RSEM Area L6 at the close of 2019. The RSEM L6 area has reached its storage capacity, and an NPAG cover has been placed over the facility. The facility will be downstream of the dam and permitted for long term storage of PAG and NPAG material subject to covering and isolation of the PAG from air. The RSEM Pond was approved for discharge in September 2019, however passive discharge has not yet occurred.

2.4 Right Bank PAG Material Management

On the Right bank PAG was primarily excavated from the Approach Channel and Spillway (550,877 m^3), the Dam Core Buttress (574,018 m^3). Smaller volumes of PAG were excavated from other areas around the Right Bank, with a detailed accounting presented below and in Figure 2-1 in Appendix A.

- RSEM Area R5A non-contact ditch (207 m^3);
- Laydown Area 32A and 32B (2,172 m^3);
- RCC Excavation (654 m^3);
- RBDT (1,512 m^3);
- Area 23 (2,794 m^3);
- Dam Core Buttress (574,018 m^3); and
- Approach Channel and Spillway (550,877 m^3).

All of the material excavated on the Right Bank was deposited in RSEM Area R5a. At the end of 2019, RSEM Area R5a contained approximately 5,298,254 m^3 of PAG.

2.4.1 Right Bank Drainage Tunnel

The RBDT is being constructed to control groundwater conditions underlying the foundation of the southern dam abutment. The RBDT portal was covered with shotcrete and completed in October 2016, allowing for advancement of the tunnel in 2017 and 2018. The majority of tunnel excavation was completed by 2019, with small amounts of PAG excavated during 2019 (1,512 m^3).

Surface runoff and seepage water collected from within the tunnel was collected and conveyed to the pond within RSEM R6.

2.4.2 Spillway Approach Channel and Dam/Core Buttress

Bedrock excavation forming the foundation for the Spillway Approach Channel area constitutes a major earthworks project on the Dam Site. In 2019, approximately 550,877 m^3 of bedrock was excavated and transported to RSEM R5a. Runoff from the spillway channel is being directed to the MWTF for treatment as PAG-contact, metals-laden water; this system was commissioned on-site in mid-2018 and continued operation through 2019. Following treatment, the water passed through a sludge/clarifying pond and was subsequently diverted to the RSEM R5b pond.

Bedrock Excavation within the Dam and Dam Core Buttress represents another major earthworks component on the Right Bank. Material volumes from this excavation totalled approximately 574,018 m^3 of PAG which was hauled to RSEM R5a. Runoff from the Dam and Dam Core Buttress is being directed to the MWTF for PAG-contact, metals-laden water prior to being diverted to the RSEM R5b pond, which was brought to site in mid-2018 and continued operation through 2019.

A summary of bedrock geochemical monitoring, runoff water quality monitoring, and inventory of material volumes by month are included in the Annual Report by Lorax Environmental in Appendix A.

2.4.3 Area 32A and 32B

Area 32A/32B is between the Approach Channel and Dam Core/Core buttress. PAG Excavated in this area totaled 2,172 m3 and was transported to RSEM R5a. Runoff from Area 32A/32B is being collected and transported to the MWTF for treatment.

2.4.4 RCC Buttress Excavation Area

Downstream of the Approach Channel, and within the RSEM R6 area, a small amount of bedrock was excavated (654 m^3) within the RCC Buttress Excavation Area. In 2019, work in this area focused around construction and surfacing of the RCC Buttress and continued work on the powerhouse and related structures and equipment. Runoff water from these areas is contained within the RCC cofferdam and is pumped to the RSEM R6 sediment pond.

Monitoring of the bedrock geochemistry and water quality of the RCC Excavation itself was completed by Lorax on behalf of PRHP (refer to Appendix A). Monitoring of the bedrock geochemistry and water quality of the powerhouse and related structures are completed by the Generating Station and Spillways (GSS) contractor, Aecon, Flatiron, Dragados, and EBC (AFDE).

2.4.5 South Bank Initial Access Road (SBIAR)

Between February and March of 2017, a road cut was constructed on the Right Bank to enable two-way haulage and site vehicle access from the upper terrace near Area A and Area 21 down to the floodplain level in RSEM R6. This excavation involved removal of approximately 139,000 m^3 of bedrock, and placement of approximately 206,000 m^3 of embankment fill material. The bedrock material was transported to RSEM R5a and runoff water is channelled to RSEM R6. No additional excavation has occurred at SBIAR during 2019.

Routine monitoring of runoff water quality from approximately 12,500 m^2 of exposed bedrock was completed by Tetra Tech on behalf of BC Hydro (Appendix D).

2.4.6 Area 23 Excavation

The Area 23 excavation is located on a terrace of the Right Bank and lies immediately west of the Substation and south of the Approach Channel Excavation. The 2019 excavation had initially anticipated the generation of 1,770,000 m^3 NPAG material for use within the Generating Station Laydown within RSEM R6. Excavating material in the area resulted in a chance find of 2,794 m^3 of PAG material which was transported to RSEM R5a.

2.5 Left Bank PAG Material Management

Excavation on the Left Bank during 2019 amounted to a total of 604,746 m^3 of PAG rock being disturbed and relocated. These construction activities were mainly conducted around the DTIP,

the DTOP, and the Central Cofferdam excavation. Excavation from these areas occurred throughout the year. Smaller volumes of PAG were excavated from other areas around the Left Bank, with a detailed accounting presented below and in Figure 2-1 in Appendix A.

- DTIP (94,401 m^3);
- DTOP (29,987 m^3);
- LBEX (15,570 m^3);
- Central Cofferdam (455,131 m^3);
- Inlet Cofferdam (10,097 m^3);
- Garbage Creek (105 m^3); and
- Left Bank Drainage Adit (4,185 m^3).

Most of the material excavated on the Left Bank was transported the RSEM Area L5 and RSEM Area L5 Extension. Small amounts were placed in RSEM Area L6 and the Left Bank Dam Core. At the end of 2019, RSEM Area L5 contained 922,232 m^3 of PAG, the RSEM Area L5 Extension contained 385,843 m^3, RSEM Area L6 contained 62,200 m^3, and the Left Bank Dam Core contained 12,345 m^3. No new material was added to the Garbage Creek Stockpile in 2019, however, a small volume was removed (105 m^3), leaving 24,120 m^3 stockpiled at this location.

2.5.1 Left Bank Excavation and Haul Road

During 2019 approximately 48,570 m^3 of PAG was exposed during excavation activities to support future dam construction. Excavated PAG was transported to the RSEM Area L5 and L5 Extension, as well as RSEM Area L6. Contact water was conveyed either to the RSEM L5 sediment pond or on occasion to the MWTF for treatment through to the end of 2019. The LBEX pond was decommissioned and infilled in Q3 2019.

A PAG exposure on the northwestern edge of the LBEX slope remains exposed from previous years excavation (noted in 2018 annual report). The exposure is being mitigated via water management on-site.

Descriptions of the PAG material geochemical monitoring and water quality monitoring are included in the PRHP Annual Report (Appendix A).

2.5.2 Diversion Tunnels (DTIP and DTOP)

Pre-construction of the Left Bank Diversion Tunnels (LBDT) commenced in 2017 and portal construction was completed in 2018. Construction progressed in 2019 on two parallel 12 m diameter tunnels which will divert river water during construction of the dam core, with tunnel excavations being completed and tunnel linings ongoing. Bedrock excavated during tunnel excavation was relocated to RSEM L5, L5 Extension, and RSEM L6. Three isolated cofferdams have been constructed outboard of the DTIP, DTOP and the Dam Core excavation area to isolate these construction areas from having hydraulic connectivity with the Peace River. Sumps within the cofferdam areas are used to collect PAG contact water which was then transported to the MWTF.

2.5.3 Central Cofferdam

Substantial work progressed on excavation activities at the central cofferdam, and a total of 421,741 m^3 was excavated from this area. Excavation occurred throughout 2019 on the Central Cofferdam and was transported to RSEM L5, L5 Extension, and RSEM L6. The risk of ARD/ML due to exposed bedrock was lined with shotcrete, where possible. PAG contact water within the central cofferdam was collected in sumps and transported to the MWTF.

2.5.4 Left Bank Drainage Adit

Construction of the Left Bank Drainage Adit commenced in October 2019. Small amounts of PAG (4,185 m^3) of PAG were excavated during construction of the portal for the Left Bank Drainage Adit. PAG contact water was redirected to the RSEM L5 sediment pond, and PAG was relocated to RSEM L5 and L5 Extension.

2.5.5 River Road

River Road was constructed by the early works contractor, Morgan Construction and Environmental Ltd., in 2015 to serve as the main access route between the upper and lower benches along the right bank. The road remains active as the main site access road along the Left Bank.

The area of bedrock which remains exposed from excavation activities required during road construction down through the Left Bank bluff is referred to as Blind Corner. Surface runoff from bedrock outcrop at Blind Corner and from the upper cut-off ditch in the Howe Pit bench is captured within a limestone rip-rap lined ditch which conveys water along River Road and is diverted to a broad expanse of ditch between culverts RR-8 and RR-9 and is not directly discharged to the Peace River. Routine monitoring of water quality within this catchment, as per CEMP Appendix E, S.5.2.1.7, is described by Tetra Tech in Appendix D.

2.5.6 Howe Pit

The Howe Pit area comprises an area which was previously disturbed by extraction of soil and bedrock material for use as construction aggregate. Bedrock remains exposed in the area. No additional disturbance of the site has been conducted as part of the Site C construction activities.

Surface runoff from the Howe Pit area drains into the L3 Creek via a pond and natural drainage channels. Water quality within the L3 Creek is being monitored by BC Hydro and is described by Tetra Tech (Appendix D).

Future management options for this area are being considered by BC Hydro.

2.6 Offsite Locations

2.6.1 West Pine Quarry

PRHP estimates that in 2019 approximately 340,000 m^3 of NPAG material was blasted at the West Pine Quarry for use at Site C. The material is periodically transported by rail to Site C to be used as feedstock for the roller compacted concrete (RCC) and riprap for the dam construction.

2.6.2 Portage Mountain Quarry

Pre-production development continued at Portage Mountain Quarry through 2019. Work activities included installation of erosion and sediment control systems, construction of the quarry access road. Material extracted from the quarry is being stockpiled on site.

2.6.3 85th Avenue Till Conveyor

The 85th avenue till conveyor was constructed over the course of 2019 and involved excavation of NPAG material. A total of 7 samples were collected from road cuts or stockpiles during excavation activities for elemental analysis and acidity testing. All material tested on the Till Conveyor corridor was classified as NPAG.

3. Overview of Water Quality Monitoring Programs related to Acid Rock Drainage and Metal Leachate Management

The CEMP Appendix E identifies responsibilities specific to BC Hydro and the contractor. In 2019, BC Hydro, as owner, and Peace River Hydro Partners, as MCW contractor, engaged qualified professionals in ARD/ML to assist with implementation of the various water quality monitoring programs identified in Table 1.

In addition to overseeing these water quality monitoring programs, Peace River Hydro Partners' qualified professional, Lorax Environmental, provided general materials management and professional advice on the topic of ARD/ML, and BC Hydro's qualified professional, Tetra Tech Canada Inc., acted in the capacity of auditor of contractor compliance with CEMP Appendix E, while also providing professional advice on the topic of ARD/ML to BC Hydro. These roles were filled in accordance with CEMP Appendix E, S.6.1.2.

Table 1 Individual Water Quality Monitoring Programs related to the ARD/ML Management Plan (CEMP Appendix E)

	Program Description	CEMP Appendix E Reference	Frequency	Duration	Geographic Extent	Program Responsibility	Monitoring Program Qualified Professional (QP), 2019
Monitoring associated with PAG-contact RSEM Sediment Ponds	**Collected/Contained Water**						
	PAG-contact RSEM Sediment Pond Water Quality Water quality sampling, and installation and operation of data loggers for measurement of pH, turbidity and electrical conductivity from PAG containing RSEM sediment ponds.	7.3.2	Hourly (*in situ* measurements) Daily (water quality sampling)	Ongoing from December 2016	Permitted PAG containing RSEM sediment ponds	Contractor (Peace River Hydro Partners)	Lorax Environmental
	RSEM Sediment Pond Toxicity Collection of acute toxicity tests (96hr LC50) from water in PAG-contact RSEM sediment ponds	7.2.1, 7.3.1	Prior to February 27, 2019: Bi-weekly (3), then monthly (12), then quarterly Following February 27, 2019: Bi-monthly. In event of failure, additional sample 96 hours after first failed sample, additional samples every 96 hours until sample passes. Targeted acute toxicity if pH drops below 6.5 for more than one hour	Ongoing from November 2016	Permitted PAG containing RSEM sediment ponds	BC Hydro	Ecofish Research Ltd. and Ecofor Consulting Ltd.
	Groundwater						
	Groundwater Monitoring Install groundwater monitoring wells upgradient and downgradient of RSEM R5a and R5b, and water quality monitoring of groundwater.	7.2.5, 7.3.3	Quarterly	Ongoing from October 2016	RSEM R5a and RSEM R5b	Contractor (Peace River Hydro Partners)	Lorax Environmental
	Peace River Surface Water						
	Peace River Mixing Dynamics and Water Quality Monitoring Field verification of modelled river mixing dynamics for the RSEM discharge sites, assessment of appropriateness of Initial Dilution Zone (IDZ) sample sites through discharge plume characterization, and collection of surface water quality samples at established upstream, far-field downstream and IDZ locations in the Peace River.	6.1.1, 7.2.3, 7.3.4	Monthly and during RSEM discharge events.	Ongoing from December 2016	Peace River at locations upstream and downstream of PAG containing RSEM areas	BC Hydro	Ecofish Research Ltd. and Ecofor Consulting Ltd.
Other Monitoring	**Surface Water**						
	Dam Site Road Cut Water Quality Monitoring Water quality monitoring at construction-related road cuts into PAG material.	5.2.1.7	Monthly (except while dry/frozen)	Ongoing from fall 2016	Throughout the dam site (left and right Peace River banks)	BC Hydro & Contractor (Peace River Hydro Partners), in their respective work areas	Tetra Tech Canada Inc. (on behalf of BC Hydro) Lorax Environmental (on behalf of Peace River Hydro Partners)
	Highway 29 Realignment Segments and Hudson's Hope Shoreline Protection *Water quality monitoring at excavations into PAG or potentially ML material during construction of these project components.*	*5.2.2*	*Monthly (except while dry/frozen)*	*N/A in 2019 (construction not yet begun)*	*N/A in 2019 (construction not yet begun)*	*BC Hydro (or the Contractor)*	*N/A in 2019 (construction not yet begun)*

3.1 Summary of Implementation Status: Monitoring Programs associated with PAG-contact RSEM Sediment Ponds

A summary of RSEMs that are designated to contain PAG material and/or PAG-contact water, and an indication of those that were operational with sediment ponds in 2019, is provided in Table 2.

Table 2 Summary of PAG-contact RSEM Sediment Pond Operational Status in 2019

RSEM	Status in 2019
Right Bank	
RSEM R5a[1]	Operational
RSEM R5b	Operational
RSEM R6[2]	Operational
Left Bank	
RSEM L5 (Phase 1)	Constructed and operational
RSEM L5 (Phase 2)	Constructed, not operational
LBEX-SP[3]	Decommissioned and infilled in 2019
RSEM L6	Operational but not currently discharging

NOTES:
[1] RSEM R5a sediment ponds were constructed in 2017 but are managed to avoid passive discharge.
[2] RSEM R6 does not receive PAG material, but its sediment ponds receive PAG-contact water.
[3] LBEX-SP is not a true RSEM sediment pond.

The focus of the monitoring programs described below is on those PAG-contact RSEMs with operational sediment ponds in 2019 only.

3.2 PAG-contact RSEM Sediment Pond Water Quality

A brief summary of monitoring undertaken at PAG-contact RSEM sediment ponds is provided below; a detailed description is included in Appendix A.

In general, operational PAG-contact RSEM sediment ponds are subject to the following monitoring regime:

- Continuous (minimum hourly) measurements of pH, turbidity, and electrical conductivity via *in situ* sonde.
- Continuous measurements of discharge to the Peace River.
- Daily collection of water quality samples for laboratory analysis of total and dissolved metals, pH, total suspended solids (TSS), turbidity, sulphate, nitrates, conductivity, temperatures, conductivity, and hardness (plus hydrocarbons, if applicable due to a spill event).

These monitoring measures are undertaken except when the pond is dry or frozen.

PAG-contact RSEM sediment pond water quality is subject to end-of-pipe discharge limits, as described in the CEMP Appendix E (Table 2), for the following parameters: total metals (cadmium, cobalt, copper, zinc), TSS, and pH. Water quality and flow data are used to calculate metals loading of each PAG-contact RSEM sediment pond to the Peace River on a daily basis.

3.2.1 RSEM R5a

The RSEM R5a facility construction was completed in early 2017. An intercept ditch upgradient of the RSEM area was completed in 2018, which discharges into the Moberly River south of the confluence with the Peace River. There are four sediment ponds (A, B, C and D) located between the RSEM and the Peace River. These ponds receive water from direct precipitation and runoff from the RSEM footprint only. Given that the large volume of shale material placed in this area retained the majority of snowmelt and precipitation, there was very little water that accumulated in the ponds. Consequently, there was no installation of sondes for *in situ* water quality measurements, or continuous flow meters, and only occasional water quality sampling for laboratory analysis. The equipment required to install, and commission sondes is available on site and will be installed in the event the ponds retain sufficient water to necessitate the systems.

The RSEM R5a ponds discharge into a riparian zone/side channel of the Peace River, and as such, are not currently approved for passive discharge. Ponds A through C discharged 2,337 m^3 between March 18th and March 22nd (combined), 2019 due to a rapid snowmelt event, but otherwise were managed throughout 2019 to prevent passive discharge to the Peace River. Pond D did not discharge to the Peace River. A pumping plan was developed and adopted in 2019 in the event the ponds require dewatering to avoid passive discharge such that discharge would occur directly to the main stem of the Peace River; this plan has not yet been utilized due to low water volumes in ponds.

During the discharge period in March, the EOP discharges exceeded short-term BC WQG at Pond A (March 18 through 21st), Pond B (March 19th through 21st), and the R5a diversion ditch (March 19th) for one or a combination of the following parameters: TSS, T-Ag, T-As, T-Cu, T-Fe, T-Mn, and T-Zn (Table 3-28, Appendix A). During this same period, the long-term BC WQG were exceeded for TSS, T-As, T-Co, T-Cu, T-Fe, T-Pb, T-Se, and T-Zn at RSEM Pond R5a Pond C (Table 3-29, Appendix A).

Metal loading calculations indicate that monthly loadings contributed from discharges of water from RSEM R5a represent only a minor fraction relative to overall metal loads in the Peace River, as measured a short distance upstream of the construction site (see Appendix A, Table 4-19 and Table 4-23 for further detail).

3.2.2 RSEM R5b

RSEM R5b sediment pond was operational as of early December 2016. In 2019, water received by the RSEM R5b sediment pond was conveyed from intercepted groundwater above the Approach Channel and from within the core trench excavation areas, runoff from the Approach Channel itself and treated effluent from the MWTF, and surface runoff from the RSEM R5b-W ditch. Surface runoff from Area A North Ditch was periodically transferred to RSEM R5b pond. There was more or less continuous discharge from this sediment pond during the year, except during frozen conditions and a brief period in early September 2019, in which the pond was completely drained to dredge sediments which had accumulated in the base of the pond. During this period the discharge from the MWTF was routed directly to the discharge pipe for the R5b pond.

The MWTF was utilized to treat potentially metals-laden, PAG-contact water throughout 2019 after its installation upgradient of RSEM R5b in July 2018. Water from the partly excavated Approach Channel was normally directed to the pre-treatment pond, located adjacent to the MWTF, and once treated, was released into the sludge pond which discharges into the

Approach Channel Diversion Channel and flows by gravity to the RSEM R5b sediment pond. The pre-treatment collection pond is upgradient of the MWTF and is used to collected PAG contact water requiring treatment. This pond is lined and received water from other PAG contact locations around the site and is transported via pumping or by truck. Following treatment in the MWTF, water is discharged to a polishing pond for sedimentation of treated effluent, which discharges to the RSEM R5b sediment pond via the Approach Channel Diversion Channel (ACDC).

The following monitoring was undertaken in RSEM R5b in 2019 (except when pond frozen):

- Continuous *in situ* measurements of pH, turbidity, and electrical conductivity with a sonde device
- Continuous measurements of flow rates to the Peace River with an ultrasonic area velocity flow meter
- Daily collection of water quality samples for laboratory analysis of total and dissolved metals, pH, TSS, turbidity, sulphate, nitrates, conductivity, temperatures, conductivity, and hardness

Exceedances of end-of-pipe limits associated with discharges from the RSEM R5b pond occurred between March 14th through 21st (TSS, Cd, Cu, Zn where metals exceedances attributable to TSS) and August 22nd to August 24th (Cd, Zn where metals attributable to dissolved Cd and Zn). Exceedance periods were short lived, and concentrations rapidly declined following the reportable exceedances.

As a result of the low pH discharge events which occurred on September 9 and 10, 2018, additional water management features were constructed on the right bank Approach Channel to increase the storage capacity and effectiveness of the care of water plan. These measures included:

- Construction of an additional 720 m^3 lined storage for PAG contact water completed July 2019;
- Construction of berms around the MWTF pre-treatment collection pond to prevent inflow of surface runoff and to increase the holding capacity to accommodate the 10-year, 24-hour storm completed March 2019;
- Construction of a groundwater diversion ditch completed July 2019; and
- Installation of remotely accessible sondes in all discharging ponds for real-time access to RSEM pond water quality data. These sensors are currently operational for all discharging ponds completed May 2019.

In addition to the above, PRHP is currently in the process of redesigning an upgradient surface water intercept ditch to divert upland runoff water to the Moberly river to reduce the potential for construction contact and PAG contact water.

Metal loading calculations indicate that monthly loadings contributed from discharges of water from RSEM R5b represent only a minor fraction relative to overall metal loads in the Peace River, as measured a short distance upstream of the construction site (see Appendix A, Table 4-21 and Table 4-23 for further detail).

3.2.3 RSEM R6

RSEM R6 sediment pond is comprised of an east and west pond (separated by a berm), each with a separate discharge outfall to the Peace River. These ponds were operational as of spring 2017, concurrent with completion of the RSEM facility construction, and continued operation

throughout 2019. The RSEM R6 facility receives only non-PAG material, hence, the runoff from this facility is non PAG-contact water, although other water reporting to the pond is PAG-contact, and thus, the pond is managed in accordance with the monitoring requirements of CEMP Appendix E.

Water reporting to the RSEM R6 East sediment ponds in 2019 originated from the CVC Batch Plant via the SBIAR ditch, as well as water transferred from the RSEM R6 West pond, Area A North Ditch, and the RCC area. In early June the 1500 Pumphouse tank near the Peace river was emptied and directed to the RSEM R6 East pond. In mid-June a carbon dioxide sparging system was installed to reduce newly noted high pH levels recorded at the EOP discharge. The RSEM R6 East pond was intermittently dewatered to the RSEM R6 West pond to prevent discharge.

From January through September 2019 the RSEM R6 West pond received water from RCC, AK pond, and Area A North Ditch. In early April a small amount of water from the AFDE R6 pond was discharged to the RSEM R6 West pond. The pond was intermittently dewatered to the MWTF pre-treatment collection pond to prevent discharge. Following September, the RSEM R6 west pond was managed to maintain low water levels by pumping water to the RSEM R6 East pond; monitoring records indicate the R6 West pond did not discharge following September. *In situ* monitoring (sonde) was in place in the RSEM R6 West pond until mid-December.

The following monitoring was undertaken in RSEM R6 East and West ponds in 2019 (except when pond frozen):

- Continuous *in situ* measurements of pH, turbidity, and electrical conductivity with a sonde device.
- Continuous measurements of flow rates to the Peace River with an ultrasonic area velocity flow meter.
- Daily collection of water quality samples for laboratory analysis of total and dissolved metals, pH, TSS, turbidity, sulphate, nitrates, conductivity, temperatures, conductivity, and hardness.

The RSEM R6 East sediment pond exceeded the RSEM EOP limit on two occasions in 2019; on June 29th (Zn) and November 26th (Cd). In both cases the exceedances appeared anomalous as the preceding days and days following the exceedances did not show high levels of either metal. Monitoring data suggests that the elevated concentrations were associated with dissolved metals (Zn) and TSS (Cd).

The RSEM R6 West sediment pond exceeded the RSEM EOP limit on several occasions:

- January 30th (Cu and Zn) however no discharge occurred;
- June 29th (Zn);
- July 6th (field pH greater than 9.0)
- August 16th to August 18th (TSS).

Exceedances of metals at the RSEM R6 West pond are attributed to dissolved forms of the metals. Concentrations of exceeded parameters typically declined after the noted exceedance except in Q1 as the ponds were not regularly discharging due to low inflows/active dewatering.

As described for RSEM R5b, metal loading calculations indicate that monthly loadings contributed from discharges of water from RSEM R6 represent only a minor fraction relative to

overall metal loads in the Peace River, as measured a short distance upstream of the construction site (see Appendix A, Table 4-22 and Table 4-23 for further detail).

3.3 RSEM Sediment Pond Toxicity

A brief summary of toxicity testing undertaken at PAG-contact RSEM sediment ponds in 2019 is provided below; a detailed description is included in Appendix B.

In general, acute toxicity of RSEM pond water was monitored before initial pond discharge, and at regular intervals thereafter (bi-weekly, monthly, and quarterly, depending on discharge frequency). Acute toxicity was evaluated using a standard laboratory assay (Rainbow trout 96-h LC50 test) performed on water samples collected directly from the outflow of each RSEM pond (or the pond itself when not discharging).

Changes were made to the RSEM Sediment Pond toxicity sampling program as per the Ecofish November 2018 memorandum[2], and as per the CWR Section 93 Order (February 27, 2019). The sampling program implemented in 2019 is as follows:

- A routine monitoring program in which samples are collected on a bi-monthly basis for acute toxicity (96-hour LC_{50} test) for each constructed pond in which sufficient water is present to sample. A sample for water chemistry shall be collected at the same time. In the event a routine test result fails the toxicity test, an additional sample shall be collected to confirm pond water quality conditions. This additional sample will be collected 96-hours following the failure of the first sample. Additional samples will be collected every 96-hours until a sample passes. After a test passes, routine monitoring will resume on a bi-monthly basis from the date of the passed sample.
- A targeted monitoring program to be initiated if a trigger is exceeded that suggests there might be elevated risk to aquatic biota due to poor water quality. Targeted sampling will be conducted on each pond with poor water quality, whether discharging or not. The trigger used to determine the need for targeted monitoring is the presence of low pH conditions in the pond. If the pH of any RSEM pond drops below a pH of 6.5, based on *in situ* monitoring devices for a period of longer than 1 hour then an acute toxicity sample will be collected, as well as water quality chemistry sample. Note that the trigger for this event is more conservative than the EOP discharge limit of pH 6.0. Once the pH in the pond has increased to within the acceptable range (defined by the discharge limits), or the rate of change in pH units has stabilized (i.e., less than -0.5 pH units/3 hour period), for 96 hours, a second sample should be collected for Rainbow Trout acute toxicity testing to confirm that water in the PAG containing sediment pond passes the acute toxicity test.

A summary of toxicity sampling for each pond is provided below.

3.3.1 RSEM R5a

Toxicity testing was initiated in the RSEM R5a temporary sediment pond in May/June 2017, until it was decommissioned. In mid-July 2017, the more permanent ponds were subsequently constructed, with design consisting of four individual cells (A, B, C, and D). Since completion, these cells have contained little water and have only discharged to the Peace River on one

[2] Ecofish Research Limited memorandum on the Evaluation and Recommendations for Site C Toxicity Testing and Peace River Initial Dilution Zone Sampling in Response to the November 2, 2018 Water Sustainability Act Order Requirements. November 16, 2018

occasion during March 2019, at which point 2,337 m^3 of water were discharged. Sampling from the ponds occurred 15 times in RSEM R5a.

In 2019, all 15 acute toxicity samples collected from the RSEM R5a ponds (cells A, B, C, and D) passed the acute toxicity test.

3.3.2 RSEM R5b

Toxicity testing was initiated in the RSEM R5b sediment pond on November 30, 2016 and continued at the prescribed frequency throughout 2017 and 2018. In 2019, based on the new toxicity sampling program implemented at site, a total of 6 acute toxicity samples were collected from this pond.

In 2019, all of the samples collected from the RSEM R5b pond passed the acute toxicity test.

3.3.3 RSEM R6

Toxicity testing was initiated in the RSEM R6 sediment ponds (west and east cells) in March and April 2017, respectively, and continued at the original prescribed frequency throughout 2017 and 2018. In 2019, based on the new toxicity sampling program implemented at site, a total of 13 acute toxicity samples were collected from this pond.

In 2019, all 13 toxicity samples (6 samples from the east pond and 7 samples from the west pond) collected from the RSEM R6 sediment ponds passed the acute toxicity test.

3.3.4 RSEM L5

Construction of the RSEM L5 ponds (two cells, east and west, divided by a berm) was completed in December 2018. The initial dilution zone (IDZ) characterization program commenced in Spring 2019, and the pond has been passively discharging since that point.

Nine samples were collected from RSEM L5 in 2019 (five samples from L5E and four from L5W). All samples from RSEM L5 passed the acute toxicity test.

3.3.1 RSEM L6

The initial dilution zone (IDZ) characterization program for RSEM L6 was completed in September 2019 during a period when the pond was drained via pumping through the discharge pipe. The pond has not passively discharged since its initial draining.

Five samples were collected from RSEM L6; all samples passed the acute toxicity test.

3.4 Peace River Mixing Dynamics and Water Quality Monitoring

A brief summary of Peace River mixing dynamics and water quality monitoring work undertaken in relation to discharge from PAG-contact RSEM sediment ponds is provided below; a detailed description is included in Appendix B.

3.4.1 Initial Dilution Zone Mixing Study

Prior to the construction of RSEM sediment ponds and any associated discharges, water quality modelling was undertaken by the project to examine the predicted mixing capacity of the Peace River through a 100 m initial dilution zone (IDZ). Field-verified mixing coefficients were obtained in 2019 at the IDZ for RSEM L5 in March 2019 and RSEM L6 in September 2019 using variances between the electrical conductivity in the discharge water and the water in the Peace River as a natural tracer.

These studies were used to verify the IDZ mixing model for each discharging RSEM pond. RSEM L5 began discharging on March 15, 2019 and RSEM L6 is planned for discharge in 2020.

3.5 RSEM Discharge/Peace River Surface Water Quality Monitoring

To evaluate compliance with water quality limits applicable at the IDZ locations downstream of each PAG-contact RSEM sediment pond discharge location (CEMP Appendix E, Table 2), a full suite of water quality parameters (including physical parameters, nutrients, anions, total metals and dissolved metals) was measured *in situ* and/or sampled for laboratory analysis. Sampling was undertaken on a monthly basis throughout the year for those ponds that were discharging in that month, and on a 5 in 30-day schedule during a period of high and a period of low flow in the year. Sampling was conducted at the IDZ locations, and also at a site upstream (upstream of all Site C construction influences), immediately upstream (just upstream of individual RSEM discharge locations), and far-field downstream (downstream of all Site C construction influences). TSS discharge limits at end-of-pipe, which are prescribed as the BC water quality guidelines for freshwater aquatic life (CEMP Appendix E, Table 2) and thus, are dependent upon background Peace River water clarity conditions, were determined through measurements collected by automated turbidity gauges located on either bank of the Peace River, upstream of the confluence with the Moberly River. A site-specific TSS:turbidity relationship was determined through frequent sampling through a range of Peace River and tributary flow conditions.

Overall, water quality criteria were occasionally exceeded at all monitoring locations due to naturally occurring Peace River conditions. There were no water quality exceedances at IDZ locations that were attributable to discharge of water from RSEM sediment ponds. The range in water quality parameter concentrations measured in 2019 were similar to those measured in 2017 and 2018 and were within historical water quality data ranges observed in the Peace River.

3.6 Groundwater Monitoring

A brief summary of groundwater monitoring undertaken at PAG-contact RSEMs is provided below.

3.6.1 RSEM R5a and RSEM R5b

Groundwater monitoring wells were installed in advance of the operation of RSEM areas R5b and R5a to monitor and characterize potential effects to groundwater due to seepage from the RSEM facility. Groundwater is monitored in four wells installed at RSEM R5a: three are installed downgradient of the RSEM (GW-1, GW-2, GW-3), and one is installed upgradient (GW-4). Similarly, at RSEM R5b, four groundwater wells have been installed for monitoring: three downgradient (GW-6, GW-7, GW-8), and one upgradient (GW-10b).

Baseline sampling was undertaken in 2016, and each well was sampled quarterly in 2017 (4 to 5 times), 2018 (10 to 11 times to account for additional monitoring requirements that were triggered based on previous results).
2019 sampling occurred as follows at RSEM R5a:

- GW-1: 4 times;
- GW-2: 4 times;
- GW-3: 4 times;
- GW-4A: 4 times;

2019 sampling occurred as follows at RSEM R5b:

- GW-6: 4 times;
- GW-7: 10 times;
- GW-8: 10 times;
- GW-10B: 4 times

The installation of wells prior to RSEM operations allows for temporal comparison of monitoring results, while the location of wells upgradient and downgradient of the RSEM facilities allows for spatial comparison at a particular point in time.

In accordance with the requirements of the CEMP Appendix E (S.7.2.5), groundwater quality is to be compared spatially (upgradient vs. downgradient) during each monitoring event. In response to baseline monitoring data indicating that concentrations of indicator parameters exceeded upgradient concentrations at both RSEM areas R5a and R5b, a *Groundwater Quality Mitigation Plan for RSEM Areas R5a and R5b* was prepared by the MCW Contractor's QP, Lorax Environmental, in June 2017. This mitigation plan presents a decision matrix with a series of compliance targets relative to baseline (2016) groundwater quality results for each RSEM, which, if exceeded, trigger additional actions, and mitigations if warranted.

In 2019 the MCW Contractor's QP (ARDML) Lorax Environmental produced a report detailing further groundwater quality monitoring and mitigation plans as Trigger 2 compliance targets had been exceeded. This report detail loading assessments due to groundwater to the Peace River. This report also establish Trigger 4 compliance targets to which future groundwater samples would be compared[3].

At RSEM R5a in 2019 the groundwater had circumneutral pH (6.3 to 6.9) and the major ion compositions at all four wells remained within the range previously characterized in 2016/2017/2018, except at the upgradient well (GW-4A), where slightly higher concentrations bicarbonate relative to previous sampling was observed. In several instances Trigger 3 compliance targets were exceeded by PAG indicator parameters in the groundwater samples.

At RSEM R5b, 2019 groundwater also had circumneutral pH (6.8 to 7.5) and is within ranges previously reported for 2017 and 2018. Downgradient groundwater quality was found to have changed as of Q4 2017 in relation to background (baseline) water quality, exceeding certain compliance triggers (as developed through the preparation of the *Groundwater Quality Mitigation Plan for RSEM Areas R5a and R5b, "the Plan"*) for PAG seepage indicator parameters (conductivity, total dissolved solids, sulphate, sodium, chloride, and cobalt or cadmium (depending on the well). These results triggered additional monitoring events (above just quarterly sampling) throughout 2018 and 2019. This also led to the development of the aforementioned groundwater loading model and Trigger 4 compliance targets. No trigger 4 compliance targets were exceeded.

Groundwater major ion concentrations in 2019 were consistent with 2018. In accordance with the Plan, these results also triggered the development of a conceptual groundwater model for RSEM Area R5b (in May 2018), and a geochemical loading model for RSEM Area R5b to assess loading rates to the Peace River and define critical groundwater loading values (August 2019).

[3] Groundwater Loading Assessment Report for RSEM R5b. Delivered by PRHP on September 4, 2019

Groundwater quality is reported on a quarterly basis under separate cover, with a compilation of annual data available in the 2019 Q4 report[4].

3.7 Dam Site Road Cut Water Quality Monitoring

Two large double lane Dam Site road cuts referred to as River Road (2015) on the Right Bank between Howe Pit and the Peace River, and the SBIAR (early 2017) on the Right Bank between Area A and RSEM R6 have been constructed to allow site vehicle access from the upper terrace to the lower flood plain. Continued exposure of bedrock materials from both of these road cuts requires that routine water quality monitoring be conducted by BC Hydro in reference the CEMP Appendix E S.5.2.1.7. Surface runoff along River Road, which contacts bedrock at Bind Corner, discharges to the Peace River through culvert RR-11. Surface runoff which contacts the bedrock at SBIAR is channelled via a lined ditch to RSEM R6 pond and does not have a direct downstream receptor. No discharge was noted to coincide with 2019 sampling events at RR-11.

Water quality sampling was attempted on a routine monthly basis from four of the River Road catchment locations as detailed in Appendix D, 1) in the lower chimney drain (LBRR-LC), 2) upstream of the lower chimney drain within the River Road ditch (LBRR-12+500), 3) at the end of the diversion pipe (LBRR-EDP), and 4) at the discharge of culvert RR-11 (LBRR-DD). Water quality data was collected from two locations and in situ measurements were collected at eight locations of a total twelve observed locations along the River Road catchment from January to December 2019, in continuation of the 2017 and 2018 monitoring periods.

Water quality measurements along River Road have indicated that run-off water quality is influenced by active ARD-ML processes within the ditch catchment. However, in past monitoring years where acidic water was noted, in 2019 the measured field pH was neutral to alkaline (between 7.59 and 9.20). Although flows are generally low and ephemeral, or inaccessible underneath the limestone rip-rap, there is some potential for run-off to impact downstream water quality. Flows in the river road ditch are currently diverted from direct discharge to the Peace River via a pipe in the ditch. This allows the water to bypass the discharge and collect further downgradient in a ditch for infiltration. No observed discharges coincided with monthly sampling events in 2019.

A total of five (5) monitoring locations are established at the SBIAR location, including the western upstream and downstream SBIAR ditch (RBSBIAR-DS and -US), eastern upstream and downstream SBIAR ditch (RBSBIAR-EDS and -EUS), and within a preserved portion of the Peace River side channel down-gradient of the SBIAR facility (RBSC-DS), to monitor for potential long-term influence of the side channel water quality from construction of the SBIAR facility. The side channel remains hydraulically connected to the Peace River. Effluent water from SBIAR is conveyed to RSEM R6 for management prior to being discharged to the Peace River.

Sampling at the RBSBIAR monitoring locations was conducted quarterly in 2018, and monthly in 2017 and 2019. The monitoring program concluded that ARD/ML processes are active on exposed bedrock at SBIAR locations. Alkalinity and pH indicate that the waters in SBIAR have consistently remained alkaline during the 2017, 2018 and 2019 monitoring periods. Screening of analytical data for the downstream ditch locations resulted in identification at the western

[4] Peace River Hydro Partners. 2019. Site C Clean Energy Project: 2019 Q4 Groundwater Quality – Monitoring Report for RSEM Areas R5a and R5b (Rev 0). PRHP Document No. SCCEP-PRHP-EN-RPT-000680. Submitted to BC Hydro on January 30, 2020.

downstream monitoring location of SBIAR of four parameters (total iron and zinc, dissolved iron and aluminum) and at the eastern downstream monitoring location of SBIAR of five parameters (total iron, arsenic, copper, zinc and dissolved aluminum) that exceeded BCAWQG guidelines during 2019.

Further description of the water quality monitoring program is included in Appendix D. As per CEMP Appendix E Section 5.2.1.7, it is recommended that water quality monitoring is continued on a monthly basis at the established locations within the River Road catchment and SBIAR catchment in 2020. Continuous monitoring will enable the effectiveness of mitigation strategies that are implemented on the shale at Blind Corner.

4. Site Audits

BC Hydro has engaged Tetra Tech as QP(ARD), in accordance with the CEMP Appendix E S. 6.1.2, to inspect and monitor various construction areas with potential for ARD/ML since June 2016. Similar to 2017 and 2018, Tetra Tech completed four site audits in 2019 (March 26-27, May 29-31, July 24-25, and September 26, 2019). Tetra Tech's summary of the audit findings is included as Appendix C.

The site audits included visual observation of the ARD/ML mitigation and PAG material management practices being conducted on site, review of the practices in accordance with the construction area Environmental Protection Plans (EPPs), and observation of any chance find bedrock exposures on site. Several samples were collected during audits to check for rinse pH and *in situ* water quality requirements to assist in the audit process.

Executive Summary

PEACE RIVER
HYDRO PARTNERS

Executive Summary

This report summarizes the results of acid rock drainage and metal leachate (ARD/ML) monitoring undertaken in 2019 as part of the Main Civil Works Contract for the Site C Clean Energy Project ('the Project'). This report has been prepared for Peace River Hydro Partners (PRHP), which holds the Main Civil Works Contract, by Lorax Environmental Services Ltd. (Lorax), PRHP's Qualified Professional (QP) for ARD/ML.

This report is intended to summarize the results of monitoring undertaken by PRHP to meet the requirements of the ARD/ML Management Plan prepared by BC Hydro for the Project (BC Hydro, 2016a), which is included as Appendix E of the Construction Environmental Management Plan (CEMP; BC Hydro, 2016b). This report has been prepared to address the annual reporting requirements, which are set out in Section 7.5 of the ARD/ML Management Plan. It describes monitoring from January 1st to December 31st, 2019.

This report summarizes:

- Observations and tests to assess the geochemical characteristics of bedrock that has been disturbed in the course of construction, including bedrock that has been exposed and excavated and relocated (Section 2);
- Monitoring of surface water quality within the construction site (Section 3);
- A summary of key findings, including onset of ARD/ML within the site, mitigation measures employed, a summary of exceedances of project-specific water quality discharge limits, and metal loads discharged to the Peace River (Section 4); and
- Conclusions and recommendations (Section 5).

Monitoring of groundwater wells installed at the site is reported under separate cover on a quarterly basis. Surface water quality monitoring for areas outside of PRHP's work areas, and in the Peace River, is undertaken by others on behalf of BC Hydro, and also reported under separate cover.

Excavations and Deposition

The CEMP states that bedrock at the Dam Site has a high potential for ARD and should be designated as potentially acid generating (PAG) or acid generating (AG). A total of more than 1.7M m^3 of bedrock was excavated in 2019. This included approximately 609,000 m^3 on the Left Bank, mostly from the Central Cofferdam and Diversion Tunnel

Inlet Portal (DTIP), and approximately 1,132,000 m^3 on the Right Bank, mostly from Dam and Core Buttress and the Spillway Approach Channel. For comparison, roughly 490,000 m^3 was excavated from the Left Bank in 2018, and just under 600,000 m^3 of bedrock was excavated on the Right Bank in 2018.

The majority of bedrock excavated on the Left Bank in 2019 was from the Central Cofferdam (455,131 m^3), DTIP (94,401 m^3) and Diversion Tunnel Outlet Portal (DTOP; 29,987 m^3) excavations. The excavated material was placed in Relocated Surplus Excavated Material (RSEM) Area L5 and the L5 Extension that was constructed to the west of the RSEM in 2019. RSEM Area L5 and L5 Extension contained 1,308,075 m^3 of bedrock at the end of 2019 Excavated bedrock was also placed in the Dam Core (12,345 m^3) and RSEM Area L6 (62,200 m^3) that was largely completed by the end 2019. .

On the Right Bank, a total of 550,877 m^3 of bedrock was excavated from the Approach Channel in 2019 to mitigate the release of ARD/ML. Additional bedrock excavations on the Right Bank included the Roller Compacted Concrete (RCC) Buttress area (574,018 m^3). Minor amounts were excavated from the Area 23 (2,794 m^3), Area 32 Laydown (2,172 m^3), Right Bank Drainage Tunnel (RBDT) area (1,798 m^3), RCC Excavation (654 m^3), and the RSEM Area R5A Diversion Ditch (207 m^3). All material excavated on the Right Bank in 2019 was placed in RSEM Area R5A. This RSEM pile contained 5,298,254 m^3 of bedrock at the end of 2019.

PAG Bedrock Monitoring

ARD/ML monitoring is undertaken in areas where bedrock is exposed or where these materials are stored. Appropriate sampling locations are determined as construction activities proceed (rather than routinely sampling at fixed monitoring stations).

Geochemical analysis of samples collected during the monitoring program include onsite rinse pH measurements to determine surface pH, as well as offsite acid-base accounting (ABA) and metal analysis. In 2019, a total of 339 samples were collected for rinse pH analysis from various locations on the Left and Right Banks (compared with 272 in 2018). Of these, 69 samples underwent more extensive geochemical testing including ABA and metals analysis (compared with 42 last year). The program was effective at identifying the onset of ARD/ML, and identification of areas where mitigation is needed, or is likely to be required.

Any bedrock exposed or excavated as part of the Main Civil Works Contract is expected to be PAG, with most stratigraphic units expected to become acidic within one year of being exposed to the atmosphere. Geochemical monitoring undertaken to date has confirmed that this is the case in several locations on both the Left and Right Banks.

Left Bank samples collected from exposed surfaces in the Central Cofferdam, Diversion Tunnel Inlet Portal and Diversion Tunnel Outlet Portal excavations have become acidic. Shotcrete has been applied to stabilize the steep benches excavated into the slopes above the portals, which also serve to minimize contact with precipitation and neutralize most ARD/ML that may have otherwise resulted. The majority of RSEM Area L5 is covered with NPAG material; however, several AG samples were collected from bedrock deposited in the southeast part of this stockpile in 2019.

On the Right Bank, a relatively large area (approximately 8 ha) of weathered bedrock was exposed in the Approach Channel throughout much of 2019 and the weathered material was generally acidic. Bedrock that has been exposed in the RCC for over a year is early stages of ARD with pH < 7.0, however, exposures are being covered by concrete structures and runoff neutralized with alkaline waters from shotcrete and cement. Samples collected in RSEM Area R5A had variable geochemical character. In general, recently placed material remains neutral while more weathered material has a lower rinse pH.

Surface Water Quality Monitoring

Surface water quality sampling was undertaken at a total of 94 stations in 2019 (as compared with 61 stations in 2018), including 36 stations on the Left Bank and 58 stations on the Right Bank. Laboratory results for a total of 2,760 surface water quality samples obtained in 2019 from these stations are summarized in this report (as compared with 1,728 in 2018). The program was effective in identifying trends and anticipating areas where mitigation is required.

In addition, instruments and dataloggers were installed and record continuous *in situ* measurements of surface water quality (pH, conductivity and turbidity) in the RSEM Area L5, R6 and R5B sediment ponds during times that the ponds were managed to discharge. Field measurements of these parameters were also obtained at the RSEM ponds and other locations to provide insight into conditions across the site.

End-of-pipe discharge limits from RSEM sediment ponds for pH, TSS, Cd, Co, Cu and Zn are set out in Table 2 in the BC Hydro ARD/ML Management Plan (BC Hydro, 2016a). Any exceedance of these limits in water discharged from RSEM sediment ponds to the Peace River is reported within 24 hours of receiving analytical results from the laboratory, and all exceedances in RSEM sediment ponds, whether discharged or not, are noted in weekly reports. The project-specific discharge limits for TSS, Cd, Cu and Zn are based on an assumed hardness of 50 mg/L as $CaCO_3$. The hardness of water discharged from the RSEM ponds, and in the Peace River is generally higher. Consequently, minor

exceedances of discharge limits for these parameters do not necessarily reflect any meaningful effect on aquatic community health.

There were minor exceedances of water discharged from PAG-containing RSEM sediment ponds to the Peace River in 2019 as a result of snow melt and larger precipitation events. There were five of these events including: (i) a minor exceedance in water discharged from the RSEM Area R6 pond on January 30th following a brief thaw; (ii) exceedances in discharge from the RSEM Area R5B and R5A ponds (A, B and C) following a major thaw starting in mid-March; (iii) exceedances in discharge from the RSEM Area R6 ponds following heavy rain in late June; (iv) exceedances in discharge from the RSEM Area L5E, R6W, and R5B ponds following approximately 60 mm of rain over several days in late August; and (v) exceedances in the discharge from the RSEM L5E and R6E ponds following rapid snow melt in late November. These are discussed in detail in the Report.

Mitigation

Mitigation measures that are being implemented to minimize exceedances of end-of-pipe discharge limits due to ARD/ML include material management (excavating or covering bedrock exposure), water management to contain water that may be influenced by ARD/ML, and water treatment to neutralize pH and remove total and dissolved metals.

Material management is the primary ARD/ML mitigation strategy to limit the exposure of AG material and the generation of PAG contact water that may trigger the implementation of additional water management. Weathered material that has been exposed for several months and is becoming acidic is monitored to determine when mitigation is required. In addition, material that is placed in RSEM disposal areas is monitored, and weathered material is covered with recently excavated bedrock or overburden.

Water management is a secondary mitigation strategy. Non-contact run-off from above the project is diverted around the site. Contact water is managed so that as much as possible is retained within the site. Water that must be released is directed to RSEM sediment control ponds, from which it is discharged to the Peace River.

Water treatment is the tertiary management strategy. Contact water that is not anticipated to meet end-of-pipe discharge limits is conveyed to a water treatment facility. An MWTF was commissioned on the Right Bank near the west end of the Approach Channel in mid-2018. Water requiring treatment is transferred to a Pre-Treatment pond and treated by the MWTF prior to discharge via the RSEM Area R5B sediment pond.

Effective mitigation of ARD/ML and preventing exceedance of the project-specific discharge limits during snowmelt and storm events will require the continued excavation or covering of weathered PAG material, and adequate water retention capacity. Excavation of weathered material in the Approach Channel was undertaken in 2019, and construction of additional storm water retention capacity within and downgradient of the Approach Channel was constructed in early 2019.

PAG-contact water from RSEM Area L6 and R5A was managed effectively in 2019, mainly by retaining it within the site and avoiding discharge. Minimal PAG-contact water was generated in RSEM Area L5 and R6. Water is transferred to the MWTF from these areas when necessary. PAG contact water from the Approach Channel was treated prior to discharge through the RSEM Area R5B sediment pond.

Chemical elements are generally referred to using their one or two letter atomic symbol. Cd denotes cadmium, for example. A T- or D- preceding the symbol denotes the total or dissolved fraction, respectively (D-Cd, for example). Molecules, functional groups, or polyatomic ions may be referred to either by name (*e.g.*, sulphate) or chemical formula (*e.g.*, SO_4).

1. Introduction

PEACE RIVER
HYDRO PARTNERS

1. Introduction

This report summarizes the results of acid rock drainage and metal leaching (ARD/ML) monitoring undertaken in 2019 as part of the Main Civil Works Contract for the Site C Clean Energy Project ('the Project'). This report has been prepared for Peace River Hydro Partners (PRHP) by Lorax Environmental Services Ltd. (Lorax), the Qualified Professional (QP) for Acid Rock Drainage (ARD) for the Main Civil Works Contract.

1.1 Purpose

ARD/ML monitoring is undertaken in accordance with the requirements of the ARD/ML Management Plan for the Project. The ARD/ML Management Plan is documented in Appendix E (Revision 5.2, dated July 26, 2016; BC Hydro, 2016a) of BC Hydro's Construction Environmental Management Plan ('CEMP', Rev. 4, BC Hydro, 2016b). In addition to the requirements outlined in the CEMP, this report is also intended to address information requirements that PRHP has received from BC Hydro to meet requests from the Independent Environmental Monitor (IEM) and B.C. Ministry of Forests, Lands and Natural Resources (FLNRO) Comptroller of Water Rights, since the last revision of the CEMP.

1.2 Scope and Outline

This report has been prepared to address the annual reporting requirements, which are set out in Section 7.5 of the ARD/ML Management Plan. It describes monitoring activities within the Main Civil Works contract work, as well as analytical results and interpretation, from January 1st to December 31st, 2019.

The ARD/ML monitoring program includes four main components:

- Observations and tests to assess the geochemical characteristics of bedrock that has been disturbed in the course of construction, including bedrock that has been exposed and excavated and relocated (Section 2).
- Monitoring of surface water quality within PRHP work areas (Section 3).
- Compiling and reviewing this information to assess the onset of ARD/ML, the effectiveness of mitigation measures including water treatment, surface water quality exceedances, and metal loads discharged to the Peace River (Section 4).
- Identifying relevant conclusions and recommendations (Section 5).

Groundwater monitoring at Relocated Surplus Excavated Material (RSEM) areas R5A and R5B is also undertaken by Lorax and PRHP and is reported on a quarterly basis under separate cover.

More specifically, this report includes a summary of:

- Monitoring of rinse pH and Acid Base Accounting (ABA) of acid generating (AG) and potentially acid generating (PAG) material excavated, and placed in RSEM areas, in accordance with Section 5.2.1.2 of the BC Hydro ARD/ML Management Plan (Appendix E of the CEMP).
- Water quality monitoring results in RSEM area sumps and sediment ponds, which receive water that has contacted PAG material. This monitoring is required pursuant to Sections 7.3.2 and 7.5.2 of the BC Hydro ARD/ML Management Plan.
- Monitoring at Dam Site road cuts in accordance with Section 5.2.1.7 of the BC Hydro ARD/ML Management Plan.
- Work conducted in 2019 in support of the planning, management, and implementation of a progressive water treatment program, based on the results of rinse pH testing and contact water quality monitoring, in accordance with Section 5.2.1.2 of the BC Hydro ARD/ML Management Plan.

This report does not include the results of monitoring undertaken in the Peace River, including monitoring in the Initial Dilution Zone (IDZ) downstream of RSEM sediment pond discharges to the Peace River, or surface water quality monitoring that is undertaken for purposes other than ARD/ML management. The results of monitoring in the Peace River may be noted or summarized only to provide context for exceedance of discharge limits and estimated metal loading from RSEM area sediment ponds. Other monitoring programs and reporting for the Project are undertaken by PRHP, and by others, on behalf of BC Hydro.

Information on geochemical monitoring is provided in Section 2, and the results of surface water quality monitoring are discussed in Section 3, as noted above. In addition, this report includes in Section 4:

- The relationship that has been established between turbidity (as measured using portable instruments in RSEM area PAG-contact sediment ponds) and total suspended solids (TSS), as determined from laboratory analysis of water quality samples (Section 4.1).
- The status in 2019 of the onset of ARD/ML (Section 4.2).

- A summary of work conducted to mitigate ARD/ML, including water management, an evaluation of water treatment requirements, and a summary of water treatment undertaken (in Section 4.3).
- A summary of any exceedances of end-of-pipe discharge limits in water discharged from PAG-contact RSEM area sediment ponds, and information on any exceedances of applicable B.C. water quality guidelines for the protection of freshwater aquatic life (WQG) at other discharge locations (Section 4.4).
- An estimation of metal loads discharged from the construction site to the Peace River, from all discharge points on both the Left Bank and Right Bank, and a comparison with metal loads carried by the Peace River (Section 4.5).
- Recommendations made by Lorax to PRHP based on 2019 monitoring results (in Section 4.6).

Section 5 summarizes conclusions and recommendations related to the geochemical monitoring program (Section 5.1), the water quality monitoring program (Section 5.2), as well as water management and water treatment within the construction site (Section 5.3).

1.3 Site Conditions

Weather conditions are relevant to the ARD/ML monitoring program. Weather affects the timing, volume and dilution of ARD/ML products that are generated and rinsed from bedrock.

In general, Site C experiences four distinct seasons, during which relatively consistent conditions occur:

- Winter – the site is mostly frozen from December until mid-March, and a snowpack accumulates. Ice accumulates over open water, except on the Peace River which does not freeze over. Intermittent thaws may occur (usually only lasting a few days) that diminish the snowpack.
- Spring – snow and ice melt from roughly to mid-March to mid-April (the timing and duration vary from year to year). This time of year is normally relatively dry.
- Summer – infrequent, relatively intense rainstorms occur, contrasting with otherwise warm and dry weather. These relatively large rain events account for a large proportion of annual precipitation.
- Autumn – infrequent storms occur. This season may include colder weather (with or without precipitation) that may result in the development of a thin snowpack, alternating with warmer weather that may result in melting of accumulated snow.

Surface water freezes with the onset of cold weather in November or December, except the Peace River which does not freeze.

The area in which the Project is located is relatively dry, with average annual precipitation of 444.7 mm, based on Canadian Climate Normals from 1981-2010 (Government of Canada, 2017) at the Fort St. John Airport (FSJA) weather station. This station is located approximately 11 km ENE of Site C, at an elevation of 695 m asl. A weather station has also been installed on the Left Bank at Site C (*i.e.*, the North Camp station), near the ATCO Two Rivers Lodge, at an elevation of 583 m asl (Figure 1-5).

1.3.1 Temperature

Daily temperature maximum and minimum values are recorded at the Site C weather station. Monthly average, maximum and minimum temperatures for 2019 are presented in Table 1-1 below. Daily maximum and minimum temperature values for 2019 are shown in Figure 1-1.

Table 1-1:
Comparison of 2019 Average Min. and Max. Temperatures at Site C Weather Station to Min. and Max. Temperatures at Fort St. John Airport (FSJA) Weather Station and Canadian Climate Normals at FSJA

	2019 Average Temperature at Site C Station (°C)		2019 Average Temperature at FSJA Station (°C)		Long-Term (1981-2010) Average Temperature at FSJA Station (°C)	
Month	**Maximum**	**Minimum**	**Maximum**	**Minimum**	**Maximum**	**Minimum**
January	-5.5	-12.1	-5.2	-13.2	-8.7	-16.9
February	-13.6	-22.0	-14.8	-23.5	-5.1	-14.0
March	4.4	-6.9	2.9	-8.1	0.1	-9.2
April	9.5	0.2	8.9	-1.9	9.1	-1.3
May	17.7	6.2	16.9	4.5	15.5	4.0
June	20.0	10.1	19.6	7.9	19.6	8.6
July	21.4	11.2	21.4	10.1	21.7	10.7
August	19.1	9.6	18.8	7.8	20.5	9.2
September	14.9	6.9	14.8	5.3	15.2	4.9
October	7.5	0.1	6.7	-1.7	7.7	-0.6
November	-0.1	-6.6	-0.5	-8.2	-2.9	-10.2
December	-4.7	-11.4	-4.5	-12.1	-7.4	-15.3

The average maximum and minimum temperatures at both Site C and FSJA in February, were cold, about 8°C colder than the long-term average. In contrast, average temperatures were about 3°C or more above the long-term average in January, March, November and December. Otherwise, average maximum and minimum temperatures at both Site C and FSJA were within 2.5°C of the long-term average at FSJA.

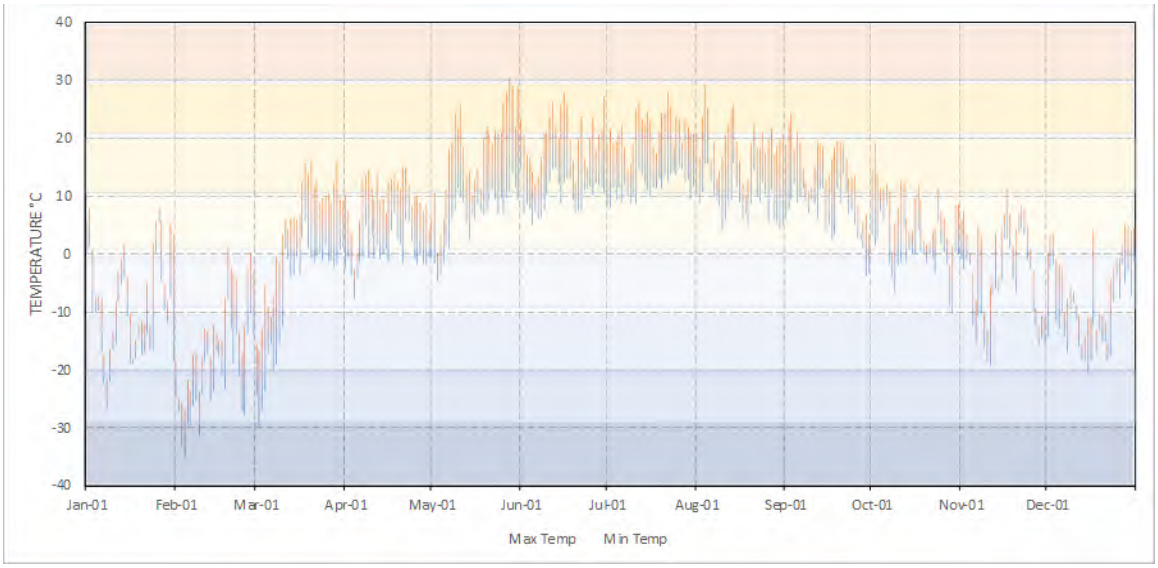

Figure 1-1: Daily Temperature Range at Site C - 2019

1.3.2 Precipitation

Precipitation affected the timing and magnitude of surface water runoff that rinsed ARD/ML products from acid-generating rock in 2019. The snowpack, daily precipitation, as measured at both FSJA and Site C weather stations, and maximum temperature recorded at Site C are shown in Figure 1-2 below. Snow accumulated during freezing periods and melted during brief autumn and winter thaws and spring freshet when maximum daily temperatures were above 0 ºC.

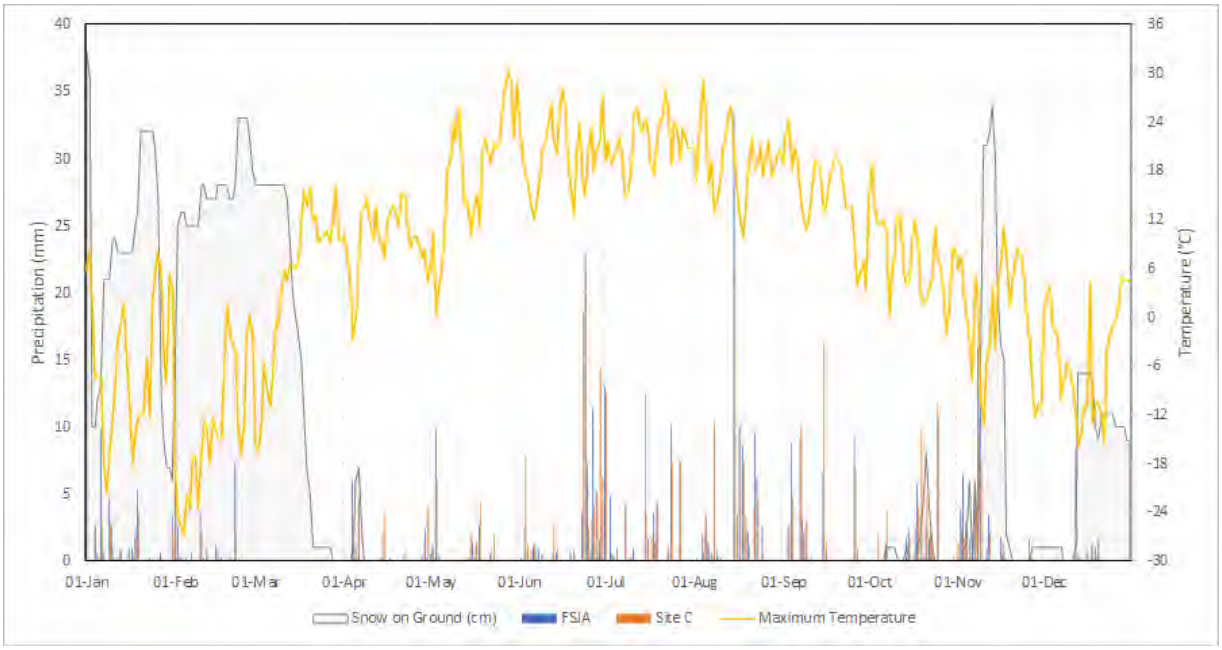

Figure 1-2: Maximum Temperature at Site C; Daily Precipitation – FSJAand Site C; and Snow on Ground at FSJA - 2019

There was a snowpack from the beginning of the year through mid-March. The snowpack reached a maximum depth of just over 30 cm in late January, decreased significantly in a short-lived thaw at the end of the month, and was renewed and sustained at a depth of more than 25 cm from early February through mid-March.

There was an intermittent snowpack in 2019 Q4. A snowpack formed in mid-November, then melted. The snowpack was renewed in mid-December, to a depth of around 10 cm, lasting until the end of the year.

Periods of heavy rain, mixture of rain and snow (greater than 10 mm) or heavy snowmelt occurred in:

- Late January when the snowpack melted rapidly during a brief thaw.
- Mid-March when the snowpack melted rapidly.
- During a rainy period in late June.
- During a major rain event in mid-August.
- During a localized rain event in mid-September.
- When a snowpack that had accumulated melted rapidly in mid-November.

Each of these events except the one in mid-September resulted in minor exceedances of end-of-pipe limits in discharge from RSEM ponds (these are discussed in more detail in Section 4.4 below).

Monthly precipitation totals recorded at the FSJA and Site C weather stations are shown in Figure 1-3 below, along with the FSJA long-term monthly average precipitation from the 1981-2010 Canadian Climate Normals. Total monthly precipitation measured at FSJA exceeds the long-term average in January, February, August and November. It was significantly below the long-term average only in March and December. In contrast, total monthly precipitation recorded at the Site C weather station significantly exceeded the long-term average at FSJA only in June and August. It was significantly below the long-term average in January, February and March, and in May, July and December. The annual totals at FJSA (477 mm) and Site C (408 mm) are roughly 8% higher, and 7% lower, respectively, compared with the long-term average at FSJA (445 mm).

Measurements of precipitation vary between the FSJA and Site C stations. The discrepancy may be due to three potential factors:

- The difference in elevation between the two sites. The higher elevation of the FSJA is expected to generally result in greater precipitation at that station, due to the orographic effect.
- The localized nature of summer rain events, which may result in more or less rainfall at FJSA as compared with Site C. Significantly higher precipitation is evident at both FSJA and at Site C from individual rain events (Figure 1-2) and for specific months in summer (Figure 1-3).
- Differences in the methodology employed at the two stations to measure snowfall. It is measured independently and converted to precipitation at a ratio of 10:1 at the FSJA station, while snowfall is melted and converted to surface water equivalent (SWE) at Site C.

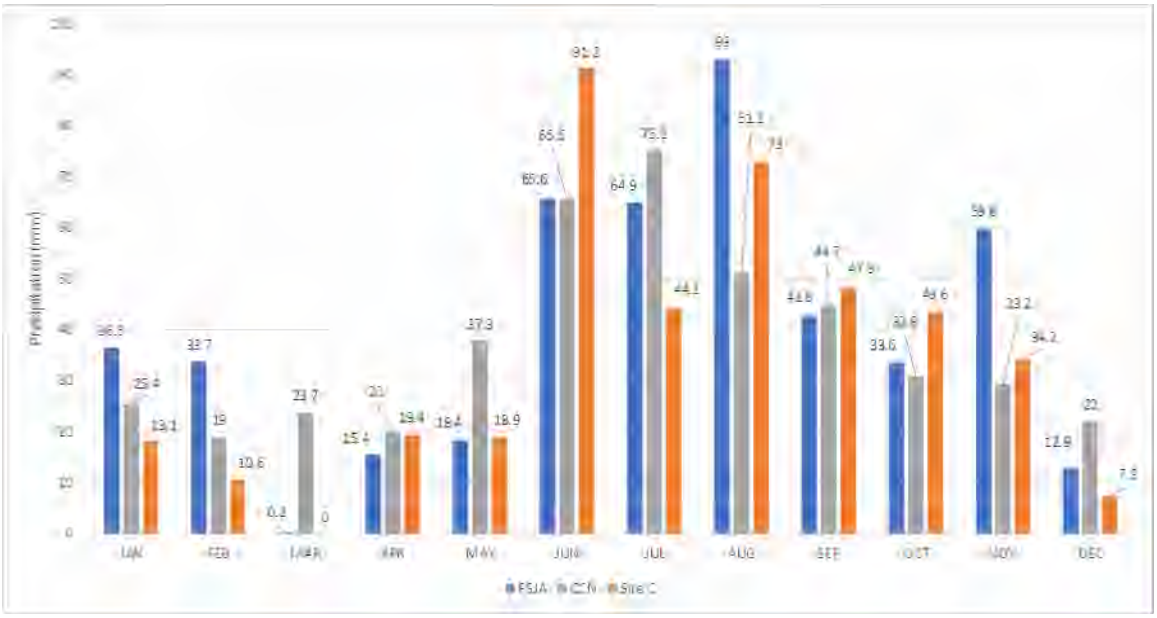

Figure 1-3: Monthly Precipitation at FSJA, Canadian Climate Normals (CCN) for FSJA and Monthly Precipitation at Site C – 2019

1.3.3 Peace River Flow

The flow in the Peace River determines available assimilative capacity and is managed by BC Hydro primarily in response to energy demand (BC Hydro, 2009). The average daily flow in the Peace River at the Water Survey of Canada Station on the Peace River near Taylor (Station 07FD002) is shown in Figure 1-4 below (daily data is not tabulated in this report).

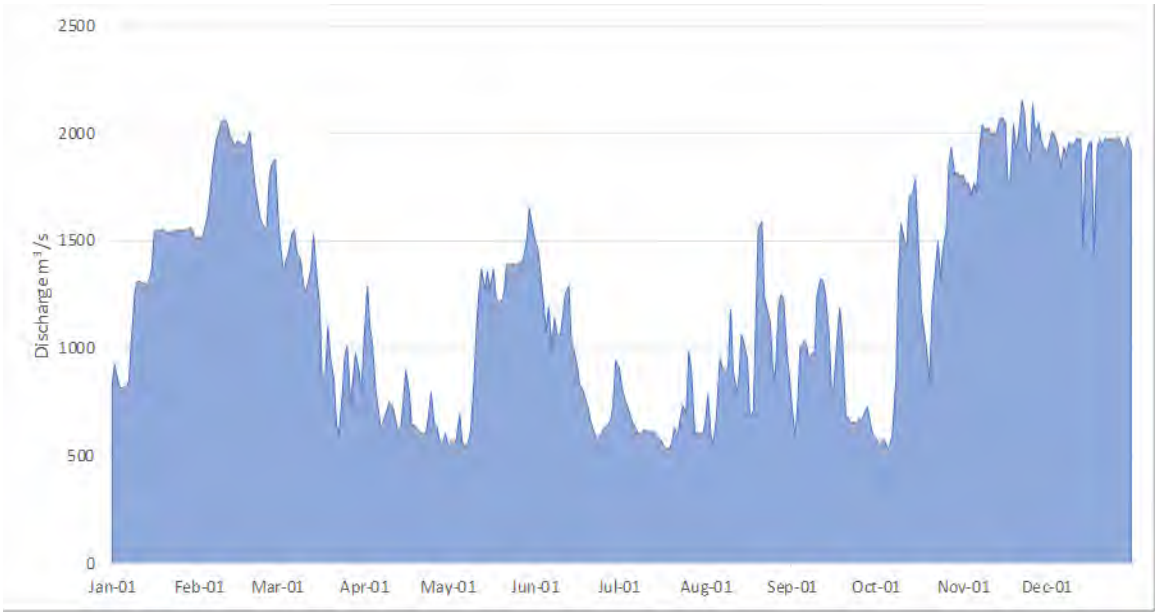

Figure 1-4: Average Daily Flow Rate at Peace River Near Taylor, Station 07FD002 (from Water Survey of Canada, 2019)

The flow in the Peace River varied from a little more than 500 m^3/s in May, July, August and October to peaks of over 2,000 m^3/s in February, November and the beginning of December. More specifically:

- The flow rate increased steadily from a rate of just over 800 m^3/s early in the year to a peak of 2,065 m^3/s on February 10th, 2019. It then declined irregularly to a low of 549 m^3/s on May 7th. This is due to regulation of reservoir levels and flow to meet demand for power generation.
- The flow rate then increased rapidly to a peak of 1,290 m^3/s on June 13th. It then decreased rapidly to a low of 586 m^3/s on June 23-24. This may have been due to snowmelt upstream of the Station in the Peace River drainage basin.
- The flow was variable between a little more than 500 m^3/s to a little more than 1,500 m^3/s through the summer months. The peaks are assumed to be due mainly to runoff from summer rain events upstream of the Station.
- The flow rate increased rapidly from 532 m^3/s on October 5th to 1,787 m^3/s on October 18th. The flow subsided to a low of 847 m^3/s on October 20th, and then surged back up to rates greater than 1,800 m^3/s through the autumn, with the exception of brief drops below 1,500 m^3/s on December 14th and 18th. The higher flow rates in November and December are due to regulation of reservoir levels and flow to meet demand for power generation.

Mixing within the IDZ for each sediment pond discharge occurs with only a portion of the total flow in the Peace River. Mixing in IDZs has been assessed by Ecofish Research Ltd. (Ecofish, 2017a, 2017b) on behalf of BC Hydro. Water quality monitoring in the Peace River is also undertaken by Ecofish and reported monthly.

1.4 Construction Activity

Construction of the Site C Clean Energy Project was initiated by BC Hydro in July 2015 and is scheduled to be completed in 2024. The general progression of construction has involved site preparation and construction of access roads, preparation of RSEM disposal areas and excavations on both banks of the river, and excavation of twin diversion tunnels on the left bank. Once the river is diverted through the diversion tunnels (scheduled to occur in Q3 2020), the isolated section of the river channel will be dewatered, and the dam core will be placed and compacted. Finally, the dam, generating station, and spillways will be completed. More information is available from BC Hydro at https://www.sitecproject.com/construction-activities.

RSEM areas are designated for disposal of excavated materials that are unsuitable for use in construction. Minimizing potential ARD/ML from this material is an important environmental protection measure for the project, as discussed in Section 5.0 of the CEMP (BC Hydro, 2016b). During construction, sediment ponds established within each RSEM area will capture surface water runoff that contacts PAG or acid generating (AG) material. This water can then be sampled, and treated if necessary, prior to discharge. The majority of PAG and AG material will be stored within the future reservoir footprint, which will slow reaction rates, and ARD/ML to minimal levels, once the material is permanently submerged in the reservoir.

A brief summary of construction activity and ARD/ML monitoring undertaken in 2019 is provided below. The volumes of PAG material excavated are discussed in Section 2.2. A plan showing the construction site and the main areas within it, is included as Figure 1-5.

The main excavations on the Left Bank in 2019 were from the Diversion Tunnels and behind the Cofferdam. Some material was also excavated from the Inlet and Outlet Portals over the same period. The excavated material was placed in the RSEM Area L5 Extension or in the Dam Core.

On the Right Bank, a large volume of PAG material was excavated from the Dam and Core Buttress and Core Trench, and a lesser volume was excavated from the Approach Channel and Spillway. This material was all placed in RSEM Area R5A.

1.5 Water Management

The water management system is continuously adapted as earthworks are undertaken. The site is subdivided into a series of catchment areas for the purpose of water management. Surface water runoff and other contact water from these areas is collected and conveyed to a series of RSEM area sediment ponds (Figure 1-6). Water is transferred to the Mobile Water Treatment Facility (MWTF) for treatment, as needed. Transfers between catchments are also periodically conducted to improve water management efficiency and ensure contact waters are routed through an RSEM sediment control pond prior to discharge. Source and destination locations for water movement are indicated in Figure 1-7.

1.5.1 Left Bank

There is one large and several smaller catchment areas on the Left Bank. Contact water catchments on the Left Bank are:

- The combined RSEM Area L5 and LBEX catchment area, from which contact water is conveyed to the RSEM Area L5 sediment control pond;
- The Diversion Tunnel Inlet Portal (DTIP) and Outlet Portal (DTOP) working areas, from which contact water is retained in storage tanks and generally conveyed to the MWTF on the Right Bank;
- The Left Bank Cofferdam area, in which surface water runoff and cement contact water are collected in sumps, treated for pH and directed to the RSEM Area L5 sediment control pond; and
- The small RSEM Area L6, from which contact water is generally conveyed to the RSEM Area L6 sediment pond.

ARD/ML 2019 Annual Report

TITLE:

Overview of PAG Contact Water Transfer to the MWTF and Between Catchment Areas in 2019

PROJECT #: A416-1

FIGURE: 1-7

P:\@Drafting\SiteC\Drafting Figures\MXD\2019_AnnualReport\Figure 1-7 Water Transfer.mxd

1.5.2 Right Bank

There are four catchment areas within the construction site on the Right Bank:

- Area A from which, contact water is directed to North ditch and transferred to R6 East or R6 West sediment control ponds;
- RSEM Area R6 (which includes Area 20/21, the Right Bank Drainage Tunnel (RBDT) and associated facilities to the south, and Roller Compacted Concrete (RCC) Buttress Excavation to the west, adjacent to the future power house), from which contact water is conveyed to the RSEM Area R6 sediment ponds;
- RSEM Area R5B (which includes the Approach Channel, Area 23 and treated effluent from the MWTF), from which contact water is conveyed to the RSEM Area R5B sediment pond; and
- RSEM Area R5A (which includes the area where the majority of excavated PAG material is being deposited on the west side of the Moberly River), from which contact water is conveyed to the RSEM Area R5A sediment ponds.

1.6 RSEM Area Sediment Pond Discharge

1.6.1 Left Bank

A total of just over 100,000 m^3 of water was discharged from the Left Bank in 2019. The RSEM Area L5 Sediment Control Ponds were completed in Q4 2018 and the first discharge commenced mid-March 2019. Most of the water discharged was from the RSEM L5 East Pond (RSEM L5E). Water was generally transferred from RSEM L5 West Pond (RSEM L5W) to RSEM L5E for discharge, as needed. Only a small volume of water was discharged from RSEM L5W early in the year. RSEM Area L6 Sediment Control Pond (RSEM L6) was commissioned in May. There was no passive discharge from RSEM L6 in 2019, however water stored in the pond was actively pumped out to the Peace River on September 5th as part of a mixing zone study. RSEM L6 was approved for discharge on November 22nd and was actively dewatered December 18th to minimize the potential for discharge. The total volumes discharged from the Left Bank are shown in Table 1-2 below, the daily volumes for each pond are presented in Appendix 1-A.

Table 1-2:
Total Volume of PAG Contact Water Discharged from Left Bank - 2019

Sediment Control Pond	Volume Discharged (m^3) 2019
RSEM L5E	99,140
RSEM L5W	834
RSEM L6	2,383
Total	**102,357**

RSEM L5E discharged daily from mid-March, with peak discharge (greater than 10 L/s) occurring during snow melt and major rain events. The daily discharge from RSEM L5E is shown in Figure 1-8 below.

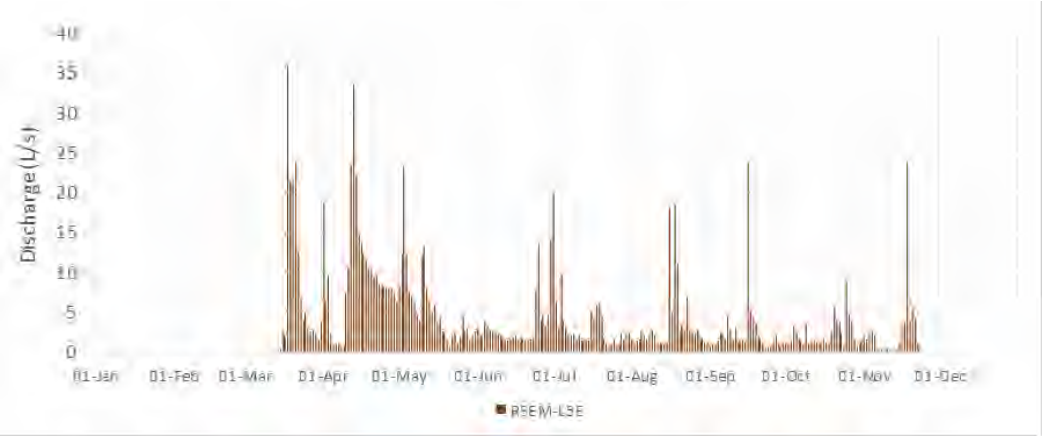

Figure 1-8: Average Daily Discharge from RSEM Area L5 East Sediment Control Pond (RSEM L5E) – 2019

1.6.2 Right Bank

A total volume of just over 800,000 m^3 of water was discharged from the Right Bank in 2019. This included roughly 300,000 m^3 from each of the RSEM Area R6 East and West Sediment Control Ponds (RSEM R6E and RSEM R6W), and just under 200,000 m^3 from the RSEM Area R5B Sediment Control Pond (RSEM R5B). A relatively small volume (a little over 2,300 m^3) was also discharged from the RSEM Area R5A Sediment Control Ponds (RSEM R5A Ponds A to D) for a few days in late March during a thaw which caused the accumulated snowpack to melt rapidly. The total volumes discharged from the sediment control ponds on the Right Bank in 2019 are shown in Table 1-3 below. Daily volumes for each pond are presented in Appendix 1-A.

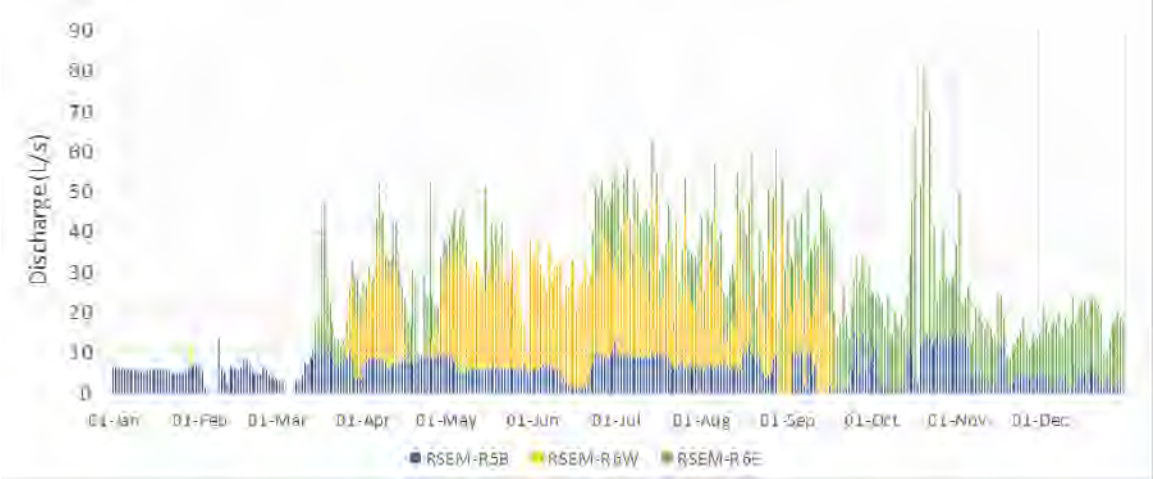
Table 1-3:
Total Volume of PAG Contact Water Discharged from Right Bank - 2019

Sediment Pond	Volume Discharged (m^3) 2019
RSEM R6E	297,609
RSEM R6W	310,655
RSEM R5B	197,790
RSEM R5A:	
Pond A	884
Pond B	452
Pond C	1,001
Pond D	0
Total	**808,391**

The individual and total average daily discharge rates to the Peace River from the Right Bank RSEM R5A, R5B, R6E and R6W ponds in 2019 are shown in Figure 1-9. Discharge from RSEM R5B was generally continuous and was typically between about 4 and 10 L/s. Discharge ceased on the following occasions:

1. From February 4th to 7th, and March 4th to 7th, when ice obstructed the RSEM R5B discharge pipe.
2. From August 29th to September 15th, when the RSEM R5B pond was bypassed to allow it to be dewatered and so that accumulated sediments could be removed from the pond. From September 3rd to 11th MWTF treated and clarified effluent was routed by pipeline directly to the RSEM R5B discharge pipe and logged as RSEM R5B discharge. There was no discharge while the pond refilled from September 12th to 15th.

The daily average discharge rates for RSEM R5B are shown in Figure 1-10 below.



Note: Graph shows combined flow from RSEM R5B, R6W and R6E (stacked bars) on days when there was discharge from multiple ponds.

Figure 1-9: Total of Average Daily Discharge Rates from Right Bank Sediment Control Ponds – 2019

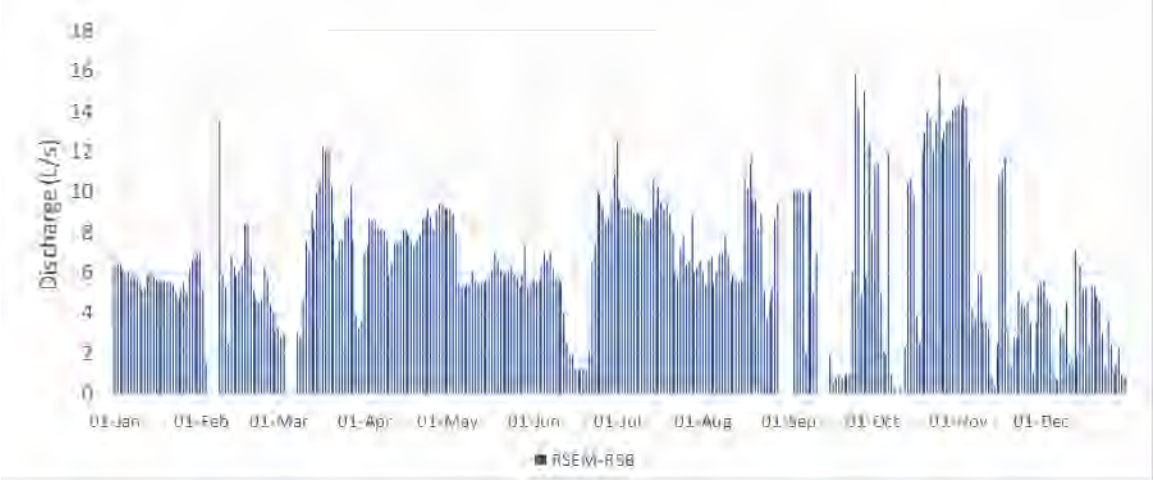


Figure 1-10: Discharge from RSEM-R5B Sediment Control Pond – 2019

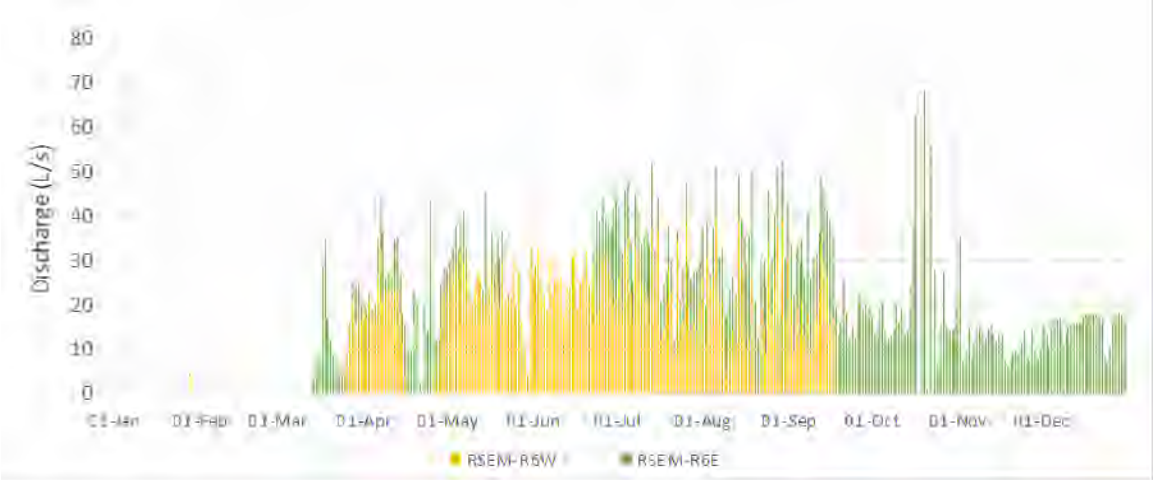
A total of over 600,000 m^3 of water was discharged from the RSEM R6E and R6W ponds in 2019. Figure 1-11 below shows daily average total discharge rates from the ponds. Small volumes were discharged from RSEM R6W starting in late January for a few days due to snow melt. Discharge resumed in late March until late April. There was no discharge from April 18-24. This was a result of diminished inflows due to RCC water being diverted to the MWTF. Discharge recommenced on April 25th and continued until September 18th. Discharge from RSEM R6W ceased from mid-September through to the end of December, as the pond was managed to maintain low water levels, and not discharge, by pumping water to RSEM R6E when necessary. During 2019, the combined discharge from the RSEM R6E and R6W ponds was generally above 20 L/s, and combined peak flows exceeded 40 L/s for short durations.



Note: Graph shows combined flow from R6W above R6E as stacked bars on days when there was discharge from both.

Figure 1-11: Discharge from RSEM-R6 Sediment Control Ponds – 2019

There was continuous discharge from the RSEM R6E pond from mid-March until late May, and then again from late June to the end of the year. Negligible to very low discharge from RSEM R6E was measured from late May to late June, coinciding with dryer than average conditions (discharge from RSEM R6W was due to dewatering of the RCC Buttress area). Discharge from RSEM R6E typically exceeded 10 L/s and peak flows exceeded 40 L/s for short durations.

1.7 Data Management

A large volume of monitoring data has been compiled since the ARD/ML monitoring program was initiated in autumn 2016. Data from the Bureau Veritas (BV, formerly Maxxam Analytics) laboratory in Burnaby, B.C. is provided in database-ready Electronic Data Deliverable (EDD) format to streamline data entry and minimize potential data entry errors. A customized water quality EDD format was developed by BV to include data for early detection of QA/QC issues. EDDs are imported directly into a proprietary database system called EQWin that is capable of efficient data retrieval and reporting, and erroneous or invalid data detection. A customized data entry program called CERES, developed by Lorax using Microsoft Access software, allows multiple PRHP staff to simultaneously enter field water quality, flow measurements and sample metadata while scrutinizing the data for potential transcriptions errors. The CERES data is further imported into EQWin to create an aggregated database of laboratory analytical and field water quality data. Both solid phase (ARD/ML analytical results, including the results of rinse pH, ABA and metals analyses) and surface water quality results (both field and laboratory measurements) are stored in the EQWin database.

2. PAG Bedrock Monitoring

PEACE RIVER
HYDRO PARTNERS

2. PAG Bedrock Monitoring

2.1 Purpose and Objectives

PRHP is required to monitor AG and PAG rock exposures and excavations in areas affected by work undertaken as part of the Main Civil Works Contract in accordance with the BC Hydro and PRHP Acid Rock Drainage and Metal Leaching Management Plans (Appendix E of the CEMP; BC Hydro, 2016a and Appendix A of EMP; Rev. 9, PRHP, 2017a, respectively). The specific objectives of this monitoring program are to:

- Confirm that the ARD/ML potential of bedrock is consistent with the original geochemical characterization work undertaken for the project that was used as the basis for the Environmental Assessment and water quality predictions;
- Monitor PAG rock exposures to provide early warning of any that have become acidic;
- Provide continuous geochemical characterization of excavated material disposed in various RSEM facilities; and
- Monitor the effectiveness of mitigation measures that have been implemented.

The baseline geochemical characterization of bedrock determined that all bedrock units that will be disturbed by dam site construction activities are PAG (KCB, 2015). This report specifies that bedrock should be assumed to be PAG or AG, unless direct sampling and analyses determine otherwise. ARD/ML monitoring is recommended for areas where bedrock is excavated and where these materials are stored. A summary of the material excavated and disposed in 2019 is included in Section 2.2.

2.2 Material Balance

Bedrock material excavation and disposal was tracked throughout 2019. A total in excess of 1.7M m^3 was excavated in 2019. This included 609,476 m^3 on the Left Bank, mostly from the Central Cofferdam and the Diversion Tunnel Inlet Portal (DTIP), and 1,132,520 m^3 on the Right Bank, mostly from the Approach Channel and Spillway and the Dam and Core Buttress and Core Trench. Most of the material excavated on the Left Bank was placed in RSEM Area L5 and the RSEM Area L5 Extension. On the Right Bank all material was placed in RSEM Area R5A.

The locations of site facilities where excavation and monitoring have occurred are illustrated in Figure 2-1.

2.2.1 Left Bank

The largest excavations on the Left Bank in 2019 occurred as a result of construction activities around the Central Cofferdam and the DTIP. In 2019, 455,131 m^3 was excavated from the Central Cofferdam and 94,401 m^3 was excavated from the DTIP (Table 2-1). Excavation in the Central Cofferdam occurred throughout 2019, with the largest volumes excavated in May and July (Figure 2-2). The majority of the excavation from the DTIP occurred from January to May.

PAG bedrock was also excavated from a number of other locations on the Left Bank. These included the Diversion Tunnel Outlet Portal (DTOP; 29,957 m^3), Left Bank Excavation (LBEX; 15,570 m^3), Inlet Cofferdam (10,097 m^3), Left Bank Drainage Adit (4,185 m^3), and Garbage Creek (105 m^3). The material excavated from Garbage Creek was previously placed PAG material.

In total, 609,476 m^3 of PAG material was stockpiled on the Left Bank in 2019. The majority of the PAG material was placed in RSEM Area L5 and the RSEM Area L5 Extension. Relatively minor amounts were placed in RSEM Area L6 and the Left Bank Dam Core. At the end of the year, RSEM Area L5 contained 922,232 m^3, the RSEM Area L5 Extension contained 385,843 m^3, RSEM Area L6 contained 62,200 m^3, and the Left Bank Dam Core contained 12,345 m^3 (Table 2-2; Figure 2-3). Material was removed from RSEM Area L5 in July and relocated to the RSEM Area L5 Extension (22,845 m^3). No material was added to the L5 Garbage Creek stockpile in 2019; however, a small volume (105 m^3) was removed. There is 24,120 m^3 of PAG material remaining at this location.

Table 2-1:
Summary of excavated PAG volumes on the Left Bank in 2019

Excavation Site	Material Excavated (m^3)				
	Q1	Q2	Q3	Q4	Total
Diversion Tunnel Inlet Portal (DTIP)	41,249	47,925	2,632	2,595	94,401
Diversion Tunnel Outlet Portal (DTOP)	9,310	780	19,852	45	29,987
Left Bank Excavation (LBEX)	7,830	7,740	0	0	15,570
Central Cofferdam	25,185	193,231	132,104	104,611	455,131
Inlet Cofferdam	0	9,287	495	315	10,097
Garbage Creek	0	0	105	0	105
Left Bank Drainage Adit	0	0	0	4,185	4,185
Total	*83,574*	*258,963*	*155,188*	*111,751*	*609,476*

Note: Due to the frequency of data tabulation, "Q1" includes volumes excavated from December 30, 2018 to March 30, 2019, "Q2" includes volumes excavated from March 31 to June 29, "Q3" includes volumes excavated from June 30 to September 28, and "Q4" includes volumes excavated from September 29 to January 4, 2020.

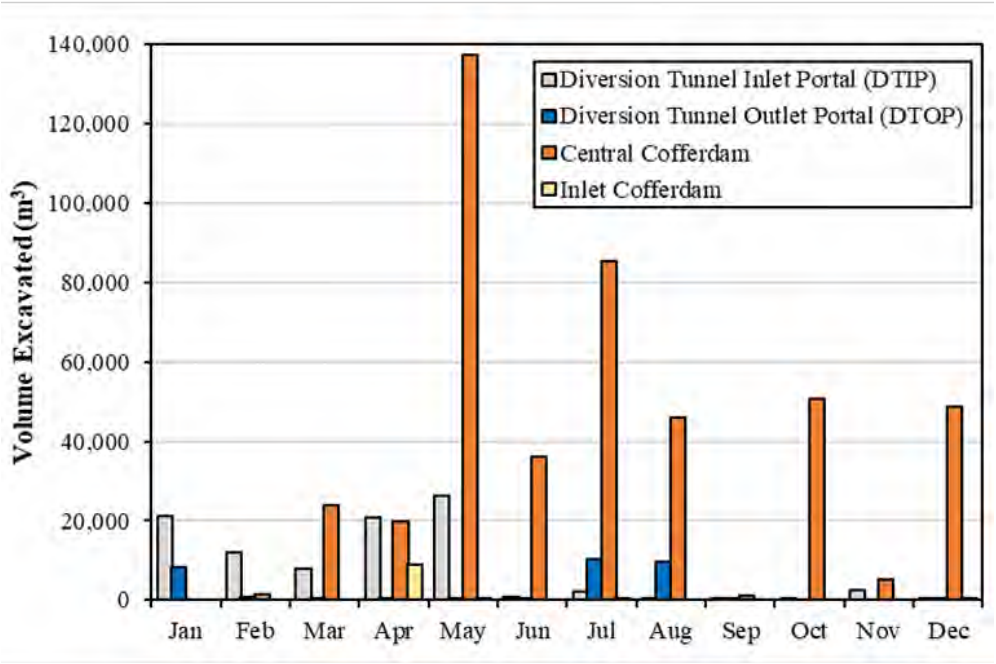

Figure 2-2: Overview of volumes excavated on the Left Bank in 2019 (the relatively minor volumes excavated from the LBEX (February to May – 15,570 m³), Garbage Creek (August – 105 m³), and the Left Bank Drainage Adit (October – 4,185 m³) are not shown).

Table 2-2:
Cumulative volume of PAG material in Left Bank stockpiles at the end of each quarter in 2019

Stockpile	Cumulative Volume Stockpiled (m³)			
	Q1	Q2	Q3	Q4
RSEM Area L5	801,104	920,185	917,207	922,232
RSEM Area L5 Extension	0	135,336	281,157	385,843
RSEM Area L6	55,614	60,160	60,160	62,200
L5 Garbage Creek	24,225	24,225	24,120	24,120
Left Bank Dam Core	0	0	12,345	12,345
Cumulative total	*880,943*	*1,139,906*	*1,294,989*	*1,406,740*

Note: Due to the frequency of data tabulation, "Q1" includes volumes excavated from December 30, 2018 to March 30, 2019, "Q2" includes volumes excavated from March 31 to June 29, "Q3" includes volumes excavated from June 30 to September 28, and "Q4" includes volumes excavated from September 29 to January 4, 2020.

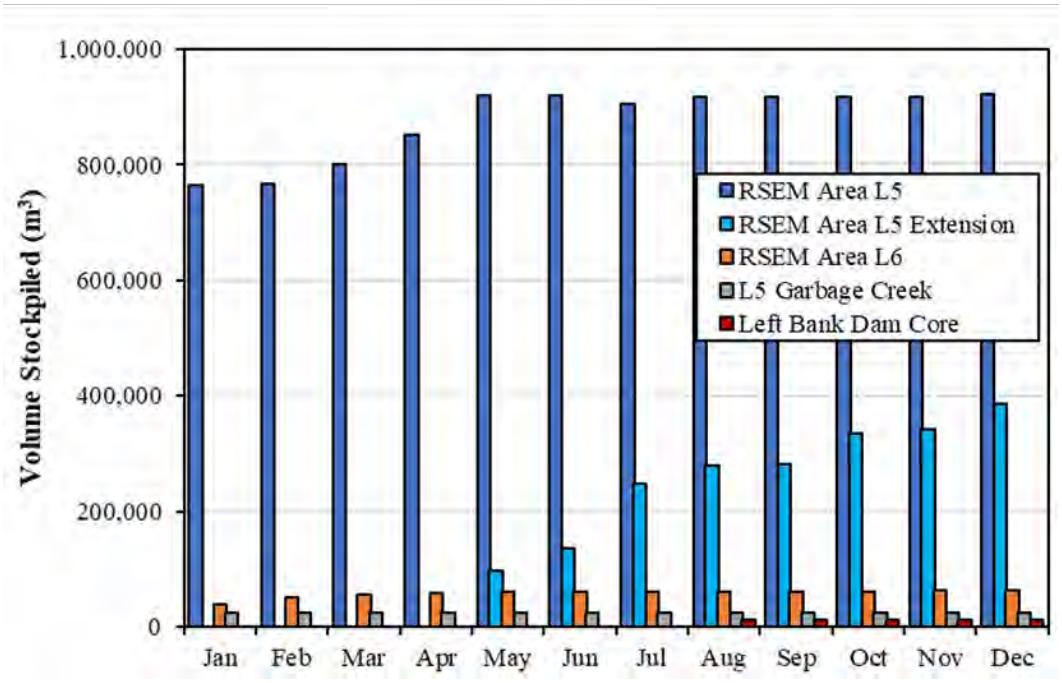

Figure 2-3: Overview of cumulative PAG material volumes stored on the Left Bank through 2019.

2.2.2 Right Bank

Excavations on the Right Bank of the Site C Project during 2019 amounted to a total of 1,132,520 m^3 of PAG bedrock. Most of this material was produced from excavations in the Dam and Core Buttress and Core Trench (574,018 m^3) and the Approach Channel and Spillway (550,877 m^3) (Table 2-3). The remaining volume was excavated from Area 23 (2,794 m^3), Laydown Areas 32A and 32B (2,172 m^3), the Right Bank Drainage Tunnel (RBDT; 1,798 m^3), the RCC area (654 m^3), and the RSEM Area R5A Non-Contact Ditch (207 m^3). An overview of the PAG material movement from these locations is given in Figure 2-4.

All of the material excavated on the Right Bank was deposited in RSEM Area R5A which, at the end of 2019, contained 5,298,254 m^3 of PAG rock (Table 2-4; Figure 2-5). The PAG material previously deposited in RSEM Area R5B remains covered by NPAG material. No additional PAG material was placed here in 2019.

Table 2-3:
Summary of excavated PAG volumes on the Right Bank in 2019

Excavation Site	Material Excavated (m^3)				
	Q1	**Q2**	**Q3**	**Q4**	**Total**
Dam and Core Buttress (including Core Trench)	0	197,201	333,054	43,763	574,018
Approach Channel and Spillway	313,794	98,279	7,602	131,202	550,877
Right Bank Drainage Tunnel (RBDT)	1,512	0	0	286	1,798
RCC Excavation Area	0	654	0	0	654
Laydown Area 32A and 32B	0	0	0	2,172	2,172
Area 23	0	44	0	2,750	2,794
RSEM Area R5A Non-Contact Ditch	0	207	0	0	207
Total	*315,306*	*296,385*	*340,656*	*180,173*	*1,132,520*

Note: Due to the frequency of data tabulation, "Q1" includes volumes excavated from December 30, 2018 to March 30, 2019, "Q2" includes volumes excavated from March 31 to June 29, "Q3" includes volumes excavated from June 30 to September 28, and "Q4" includes volumes excavated from September 29 to January 4, 2020.

Table 2-4:
Summary of cumulative volume of PAG material in the Right Bank stockpiles at the end of each month in 2019

Stockpile	Cumulative Volume Stockpiled (m3)			
	Q1	**Q2**	**Q3**	**Q4**
RSEM Area R5A	4,481,040	4,777,425	5,118,081	5,298,254
RSEM Area R5B	363,618	363,618	363,618	363,618
Cumulative total	*4,844,658*	*5,141,043*	*5,481,699*	*5,661,872*

Note: Due to the frequency of data tabulation, "Q1" includes volumes excavated from December 30, 2018 to March 30, 2019, "Q2" includes volumes excavated from March 31 to June 29, "Q3" includes volumes excavated from June 30 to September 28, and "Q4" includes volumes excavated from September 29 to January 4, 2020.

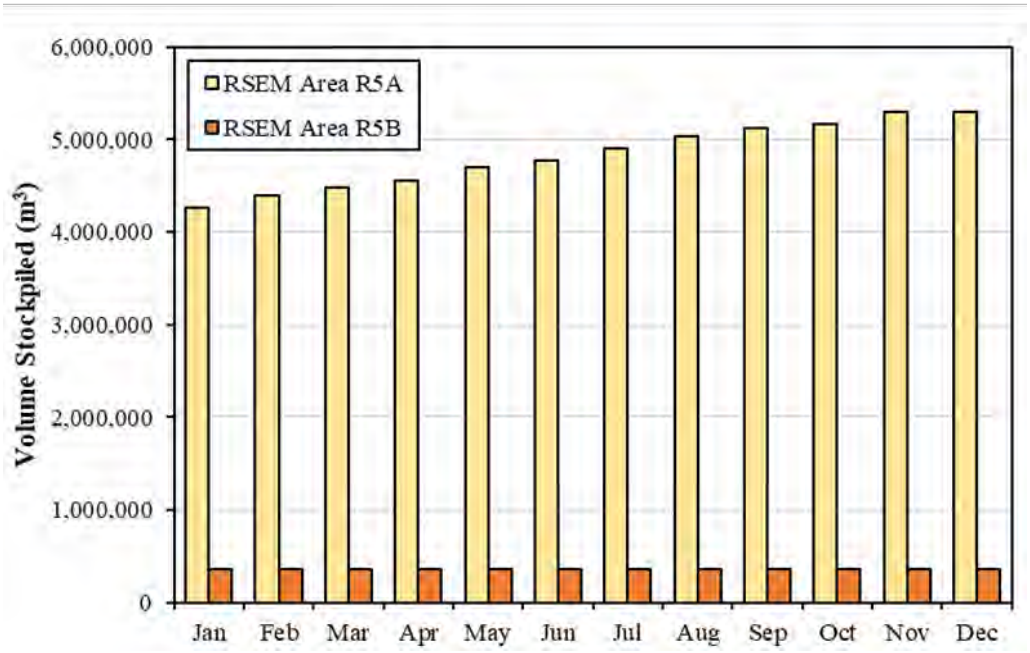

Figure 2-5: Overview of cumulative PAG material volumes stored in the RSEM R5A and RSEM R5B disposal areas in 2019

2.3 Monitoring Program Summary

ARD/ML monitoring is undertaken in areas where bedrock is excavated or where these materials are deposited. Appropriate sampling locations are determined as construction activities proceed rather than routinely sampling at fixed monitoring stations.

Geochemical analysis of samples collected during the monitoring program include rinse pH measurements to determine surface pH, as well as acid-base accounting (ABA) and solid phase metals analysis. Rinse pH monitoring is generally only conducted where samples were previously identified to produce circumneutral to alkaline drainage (rinse pH > 5.5). Where acidic drainage is prevalent, ARD mitigation strategies are identified and recommended. The original monitoring framework is described in PRHP's Acid Rock Drainage and Metal Leachate Management Plan (PRHP, 2017b) which is Appendix A of PRHP's Environmental Management Plan (PRHP, 2017a).

A proposed revision to this management plan is that an annual ARD/ML Sampling Plan be developed in the first quarter of each calendar year based on current site conditions and the additional operational experience gained in the previous year. The 2019 sampling plan recommends that new and confirmatory samples are collected from the major active and inactive excavation sites, RSEM deposition areas, and temporary PAG stockpiles (Lorax, 2019a). This sampling will direct material handling and storage strategies such as the placement of a cover or fresh PAG within RSEM areas.

In 2019, geochemical sampling was completed during seven sampling visits by Lorax personnel. Sampling occurred in January, February, April (two visits), late July/early August, and October. The site visits early in the year focussed on specific areas of the site. In January, only RSEM Area L6 was sampled, in February only the Approach Channel and RSEM Area L6 were sampled, and in the first of the April site visits only Area A and the 85th Avenue Conveyor area were sampled. The remaining site visits covered the full site. PRHP personnel collected two additional samples along the 85th Avenue Conveyor in May and assisted with the October sampling. An additional three samples were collected by BC Hydro personnel within the RCC excavation in early August. In total, 339 samples were analyzed for rinse pH (Table 2-5). Of these, 69 samples underwent more extensive geochemical testing including ABA and metals analysis.

2.3.1 Sample Collection

Sample collection methods varied depending on the type of material being sampled. Samples collected from excavation sites were collected as linear trench samples, where a pick or hammer was used to excavate an approximately 1 m cut into the excavation face perpendicular to the bedding plane. Samples collected from the surface of PAG stockpiles and other graded or compacted areas were collected from shallow trenches, approximately 1 to 2 cm in depth. Trenches were dug with a pick. A sample was collected from the entire length of the trench (ranging from about 20–100 cm) at each location.

Table 2-5:
Overview of Sample Distribution and Analyses Conducted

Location	Rinse pH	ABA and Metals
Left Bank		
RSEM Area L5	46	4
RSEM Area L5 Extension	22	4
RSEM Area L6	30	23
Left Bank Excavation (LBEX)[a]	7	0
Central Cofferdam and Dam Core	9	4
85th Avenue Conveyor	7	5
Right Bank		
RSEM Area R5A	87	7
Approach Channel	92	8
RCC Excavation	7	4
Right Bank Dam Core	5	2
Area 23	1	1
Area A – Excavation	13	2
Area A – Phase 2 Crusher Stockpile	13	5
Total	**339**	**69**

Note:
[a]Includes a sample collected from the LBEX Bluff

2.3.2 Analytical Methods

The surface rinse pH is conducted on the <2 mm particle size fraction (sorted by dry sieve) with no particle comminution. The procedure is based on that described in the Prediction Manual for Drainage Chemistry from Sulphidic Geologic Materials (Price, 2009). The rinse pH analyses were conducted at BV in Burnaby, BC, except for the three BC Hydro samples collected in August and all of the October samples which were analyzed on site.

ABA and metals analyses are conducted at BV Labs as follows:

- Neutralization potential (NP) is determined using a Modified Neutralization Potential method, following the method outlined in Marchant and Lawrence (1991).
- Total sulphur (S) is determined using a LECO furnace.
- Sulphate-S is determined by the procedure outlined in ASTM D2492-02, *Standard Test Method for Forms of Sulphur in Coal*. In this procedure, sulphate-S is dissolved with HCl.
- Sulphide-S is determined by difference (Total S – Sulphate S).
- Solid phase metals analyses are conducted on pulverized samples by digesting 0.50 g in *aqua regia* at 95°C for one hour. The extract is then diluted to 10.0 mL and analyzed for metals by inductively coupled plasma mass spectrometry (ICP- MS).

2.3.3 Classification of ARD Potential

The ARD potential of different geologic materials was defined prior to the start of construction, to facilitate effective material management. The criteria for determining the ARD potential of geologic materials that are excavated at the Project are defined by its Technical Specifications (IET, 2015). The acid generating potential of overburden and bedrock is also defined in Appendix E of BC Hydro's CEMP (BC Hydro, 2016a).

ABA criteria for classifying excavated material as PAG or NPAG were defined by the ratio of NP to acid potential (AP) as per IET, 2015. The NP/AP ratio, or net potential ratio (NPR), was used to identify PAG and NPAG mine rock. It is calculated from modified NP and total S AP, and is defined as:

- PAG: Material with an NPR ≤ 2; and
- NPAG: Material with an NPR > 2.

In addition to the above ABA criteria, a sample is considered AG that has a pH < 5.5 when tested using traditional paste or rinse pH methods.

The potential for ARD from various geologic materials disturbed at the Project site has been assessed by a variety of geochemical test work (KCB, 2015). These initial analyses show that the shale bedrock units are PAG, while the overburden materials are NPAG. Since site excavations have been initiated, additional refinement was required for material types that cannot be readily classified as 'bedrock' or 'overburden'. These material types are largely restricted to the area around the Left Bank Excavation (LBEX) and include:

- Bedrock colluvium;
- Overburden colluvium;
- Weathered bedrock; and
- the transition zone between bedrock and overburden.

The ARD/ML designation of these materials was not included in Appendix E of BC Hydro's CEMP (BC Hydro, 2016a) or geochemical baseline studies (KCB, 2015). Based on ARD/ML monitoring data, classifications have since been developed by Lorax, which are shown in Table 2-6 below. A more detailed description of the rationale and details of the classification system is provided in the *Field Classification of Potentially Acid Generating Materials* (Lorax, 2017).

Table 2-6:
Acid Rock Drainage Classification for Different Geologic Material Types

Material Type	ARD Classification
Overburden[1]	NPAG
Overburden Colluvium[2]	NPAG
Transition Zone (<15% shale)[1]	NPAG
Transition Zone (>15% shale)[1]	PAG or AG*
Bedrock Colluvium[2]	AG
Weathered Bedrock[2]	AG
Fresh Bedrock[1]	PAG

[1] Defined in CEMP (BC Hydro, 2016b)
[2] Defined in LBEX (Lorax, 2017)
*Classified as AG or NPAG depending on weathered shale content.

2.3.4 Quality Assurance and Quality Control

The quality assurance and quality control (QA/QC) program for ABA and metals analyses involves a variety of internal laboratory protocols. These protocols involve

duplicate samples and analytical standard analysis. About one duplicate was measured for every 10 samples at BV Labs. Internal laboratory quality control at BV Labs adheres to a precision specification of ±20% for metals and ±30% for sulphur and carbon species.

Neutralization potential precision specifications at BV Labs vary depending on the quantity of NP:

NP > 20 kg $CaCO_3$/t = ± 15%;

NP < 20 and > 10 kg $CaCO_3$/t = ± 20%; and

NP < 10 kg $CaCO_3$/t = ± 5 kg$CaCO_3$/t.

Any laboratory duplicate result or standard that does not adhere to the precision specifications triggers a re-analysis. Complete documentation of analytical QA/QC protocols are provided in Appendix 2-A.

The rinse pH testing for the October 2019 samples was conducted on site by PRHP personnel. In order to confirm the reproducibility of results from the October field rinse pH measurements, a duplicate from approximately 1 in 10 field samples was submitted to BV Labs for analysis. The QA/QC results from October 2019 confirm that the field rinse pH measurements are sufficient to identify acidic samples, given the correlation between field and laboratory rinse pH shown in Figure 2-6 below.

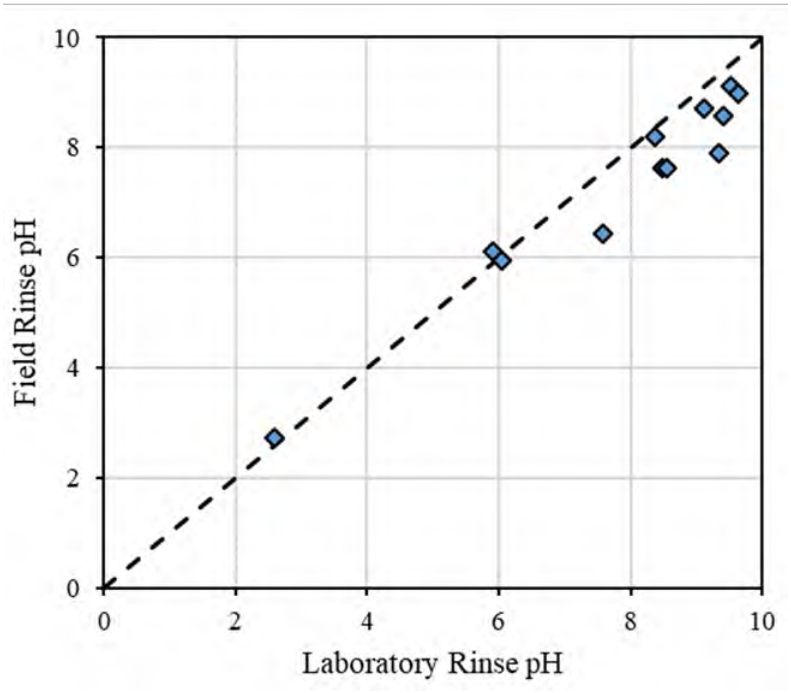

Figure 2-6: Comparison of field and laboratory rinse pH measurements for October 2019 samples

2.4 Geochemical Results

2.4.1 Rinse pH

Rinse pH was identified as the primary geochemical parameter to assess whether a bedrock excavation or storage site is actively releasing net acidic drainage. The rinse pH values are used to group the samples into three categories representing neutral/alkaline (pH ≥ 7), slightly acidic/inert (5.5 < pH < 7), and acidic character (pH < 5.5). Permanent stockpiles in which acidic rock is identified require further mitigation such as covering with overburden. Management measures for excavation faces may include the collection and management of runoff or application of shotcrete. Geochemical monitoring is continued in areas where circumneutral rinse pH values are measured. The full database of rinse pH values for the 2019 samples is shown in Appendix 2-B, Table 1.

2.4.1.1 Left Bank

In 2019, samples on the Left Bank were collected at RSEM Area L5 (n = 46), the RSEM Area L5 Extension (n = 22), RSEM Area L6 (n = 30), the Central Cofferdam and Dam Core (n = 9), the LBEX (n = 6), the Left Bank Bluff (n = 1), and the 85th Ave Conveyor (n = 7) (Figure 2-7).

Samples from RSEM Area L5 and the RSEM Area L5 Extension were collected from the locations where PAG material was visible at the surface. The area between the two sampling regions has been covered with overburden. Both of these stockpiles were sampled in Q2 through Q4 2019. The majority of samples from RSEM Area L5 (31 of 46 samples) and the RSEM Area L5 Extension (17 of 22 samples) had neutral/alkaline rinse pH. Of the remaining samples from RSEM Area L5, six had rinse pH between 5.5 and 7 and nine samples were currently acidic (rinse pH < 5.5). Acidic samples were collected from RSEM Area L5 during each of the sampling events and these were generally restricted to the lower slopes on the eastern end of the RSEM Area L5 pile. It is recommended that the exposed PAG bedrock in this stockpile is covered with overburden in order to restrict acidic runoff from the exposed PAG surface from entering the RSEM Area L5 sediment pond. The AG rock in RSEM Area L5 should be relocated to allow for resloping of the RSEM Area L5 stockpile to a grade that can be covered with neutral PAG rock or NPAG overburden to limit the ingress of oxygen and water into the AG material.

Four samples with rinse pH between 5.5 and 7 and a single acidic sample (rinse pH 3.6) were collected from the RSEM Area L5 Extension in 2019. Overall, the proportion of samples with rinse pH < 7 has increased in each quarter and the median rinse pH has decreased. It is recommended that the exposed PAG material in the RSEM Area

L5 Extension is covered with fresh PAG rock or overburden once the snow has melted in order to prevent the development of acidic runoff from the stockpile.

Samples were collected from RSEM Area L6 in each quarter of 2019. Coverage of this area with overburden was underway at the end of Q1 and the majority of the surface was covered by the end of Q2. The exposed PAG material in Q3 and Q4 was generally restricted to the sampled areas west of the road to the bridge connecting the Left and Right Banks. One AG sample was collected in Q1 2019 and all other samples have had rinse pH values above 7. The exposed PAG material should be covered with overburden or moved to another stockpile prior to becoming acidic.

The majority of the material exposed in the LBEX is overburden; however, shale is exposed near the northwestern edge of the LBEX and at the base of the LBEX along Bench 0. In Q3, two samples were collected from the northwestern exposure and confirmed that this material is AG. An overburden sample was also collected from the LBEX and had neutral rinse pH. Three samples were collected along Bench 0 in Q4 and all were AG. The ponded water near these sampling locations was acidic (field pH < 4). The bluff below the LBEX was sampled in Q3. This sample was AG, which is in agreement with the results of the 2018 sampling in this area.

Shale has been excavated from the Central Cofferdam and was exposed on the floor of the excavation. Samples were collected from this area in Q3 and Q4 2019. All samples either had rinse pH between 5.5 and 7 (3 of 9 samples) or neutral/alkaline rinse pH (6 of 9 samples). One of the Q4 samples with neutral rinse pH was mixed shale and overburden that was placed in the Left Bank Dam Core. All other samples were either of stockpiled PAG material or bedrock exposed at the edge of the excavation. Continued monitoring of exposed PAG material within this excavation is recommended.

Material was sampled along the 85th Avenue Conveyor construction corridor in Q2 and Q3. These samples were either collected from road cuts or from stockpiles along the corridor. Two of seven samples were collected from a road cut approximately 0.8 km northeast of the ATCO camp. The remaining five samples were collected from the W3 area, located approximately 3.5 km northeast of the main construction area. All samples were clay to silty clay and had neutral rinse pH values between 7.1 and 8.3.

2.4.1.2 Right Bank

Right Bank sampling in 2019 focused on RSEM Area R5A (n = 87) and the Approach Channel (n = 92). Samples were also collected from the RCC area (n = 7), the Right Bank Dam Core (n = 5), Area 23 (n = 1), and Area A (n = 26). The Area A samples include bedrock samples from the excavation (n = 13) and overburden samples from the Phase 2 Crusher stockpile (n = 13).

RSEM Area R5A was sampled in Q2 through Q4 2019 (Figure 2-8). Overall, material placement in RSEM Area R5A has minimized the exposures of AG material at the surface through both placement of overburden and fresh PAG rock. The majority of samples collected in 2019 were neutral/alkaline (67% overall); however, approximately 20 to 25% of samples collected in each round of sampling were AG. In Q2, weathered AG material remained exposed in two areas along the slope at the western edge of RSEM Area R5A and a third area along a berm on the eastern edge above RSEM R5A Pond B. In Q3, AG samples were collected from near the central portion and from near the southern end of RSEM Area R5A. Sampling in Q4 confirmed that one of the areas along the slope at the western edge identified in Q2 remains exposed and is AG. Three additional AG samples were collected in Q4. Two of these samples were from relatively minor stockpiles near the northern edge of RSEM Area R5A and the third was from a natural slope that contained a mixture of soil and weathered shale. Coverage of the moderate priority (rinse pH 5.5 to 7.0) to high priority (rinse pH < 5.5) areas with fresh bedrock and/or overburden should continue in order to minimize the surface exposure of AG material.

The Approach Channel was sampled in Q1 through Q4 (Figure 2-9). The purpose of the Q1 round of sampling was to determine if the amount of excavation that took place in Q4 2018 on the Approach Channel benches was sufficient to expose less weathered bedrock. Unweathered PAG bedrock has previously had a higher rinse pH (> 7.0), with runoff from this material having acceptable water quality. The majority (67.5%) of the samples collected in the Q1 sampling event were AG and further excavation would be required to expose unweathered material. Following this sampling excursion, it was decided that rather than conducting further excavations to remove the weathered surface material, the runoff from the Approach Channel would be collected in a pond constructed at the base of the northwestern side of this area. The water from this pond would then be treated at the MWTF. In Q2 and Q3, the majority of samples from the Approach Channel were AG (64%) and only 3 of 39 samples collected in these two sampling events had rinse pH > 7. In Q4, 11 of 13 samples (85%) were AG and no samples had rinse pH > 7. Significant excavation of the Approach Channel is expected in 2020, which will expose fresh bedrock surface.

Limited sampling was conducted in the RCC Excavation area in Q2 through Q4 2019 (n = 7). The majority of samples had rinse pH values between 5.5 and 7. The Q3 samples were collected by BC Hydro personnel and analyzed in triplicate. Two of the three rinse pH measurements for one of the samples were less than 5.5; however, the average of the three values was above 5.5. Continued monitoring of any exposed PAG slopes with the RCC Excavation is recommended until the slopes are covered with shotcrete.

The Right Bank Dam Core excavation area was sampled for the first time in Q4 2019. Samples were collected from the base and sides of the excavation, and from minor stockpiles within the area (n = 5). All samples were neutral to alkaline with rinse pH values ranging from 7.9 to 9.0 (Figure 2-9).

A dark grey clay unit was sampled in Area 23 during the October 2019 site visit. The sample from this area had a rinse pH of 7.9 and a low total S (0.08%) and high NP (145 kg $CaCO_3$/t. This non-bedrock sample is NPAG.

In Area A, both exposed bedrock and the overburden stockpile were sampled in 2019. Weathered bedrock has been exposed at the base of the excavation in Area A. Areas of exposed shale are relatively minor overall and generally restricted to the areas near the sampled locations. Samples were collected in Area A in Q2 through Q4 2019. In Q2, three of the eight samples collected from Area A were AG and an additional four samples had rinse pH values between 5.5 and 7.0. Only one sample, which was mixed overburden and weathered shale, had rinse pH > 7. The three samples collected in Q3 included mixed overburden and shale (pH 7.80), fresh shale (pH 7.41), and weathered shale (pH 2.54). Weathered shale was sampled from two locations in Q4 and both samples were AG.

The Phase 2 Crusher stockpile in Area A was sampled in April 2019 to determine if there was any ARD/ML potential associated with processing this material. Minor shale (<5%) was encountered at two locations, which were both sampled. In total, 13 samples of overburden material were collected from or directly below the stockpile. All samples collected as part of this study had rinse pH > 7 (range: 8.6 to 9.0).

2.4.2 Solid-Phase Geochemistry

This section presents the solid-phase geochemical results for the samples submitted for ABA and solid phase metals testing in 2019. Complete monitoring results are presented in Appendix 2-B. Total sulphur AP and modified NP are used to calculate NPR for the majority of samples. All samples with NPR values <2 are classified as PAG, and samples with a rinse pH or paste pH <5.5 are classified as AG (Section 2.2.1). Metal enrichment is determined by comparing metal concentrations to average upper continental crustal abundance (ACA) as per Rudnick and Gao (2014) (Table 2-8).

Table 2-8:
Average upper continental crust abundance used to evaluate metal enrichment

Element	units	Average Continental Abundance

Zn	ppm	67

2.4.2.1 Left Bank

Forty of the 122 samples collected on the Left Bank in 2019 were submitted for further geochemical analysis, including samples from RSEM Area L5 (n = 4), RSEM Area L5 Extension (n = 4), RSEM Area L6 (n = 23), the Central Cofferdam and Dam Core (n = 4), and the 85th Avenue Conveyor Corridor (n = 5). The rinse and paste pH measurements generally show good agreement for the Left Bank samples (Table 2-9). This indicates that there is no additional stored acidity or buffering capacity within the particles. One of the samples from RSEM Area L6 had a slightly lower paste pH relative to rinse pH (8.40 vs. 9.96). This indicates that there is some stored acidity within the particles that is released when pulverized for the paste pH analysis. Both rinse and paste pH values are circumneutral to alkaline for the majority of samples. Only one sample collected from RSEM Area L6 in January 2019 had acidic pH values (paste pH = 4.5; rinse pH = 3.9).

The total S for 2019 Left Bank samples ranges from 0.51% (RSEM Area L6; Central Cofferdam) to 2.1% (RSEM Area L5 Extension), excluding the conveyor samples (Table 2-9). The 85th Avenue Conveyor samples had lower total S (0.14 to 0.28%). The sulphur balance is made up of variable proportions of sulphate S and sulphide S. Sulphide S is typically an acid generating form of sulphur, whereas sulphate S may be in either acid generating or non-acid generating forms. The total S for the 2019 Left Bank samples is present dominantly as sulphide S (Figure 2-10). The AG sample collected from RSEM Area L6 had an elevated sulphate value (0.72%), which is likely due to the sample being more weathered. The sulphur for the 85th Avenue Conveyor samples is dominantly sulphate S (0.11 to 0.23%). Sulphide S is less than 0.1% in all conveyor samples.

Due to the presence of an acidic sulphate salt precipitate in some samples previously collected at site, the total S is typically used to calculate the acid potential (AP). A more detailed characterization of samples from the W3 area of the 85th Avenue Conveyor Corridor was conducted and included sulphur speciation and petrographic descriptions (Lorax, 2019). This analysis concluded that the sulphate S present in these samples did not contribute to the AP and that an AP calculated based on the sulphide S was more appropriate for samples from this area.

Modified NP was <30 kg $CaCO_3$/t in all samples, except for two of the samples from the 85th Avenue Conveyor Corridor. The conveyor samples had variable modified NP with three samples having low modified NP (≤6.5 kg $CaCO_3$/t) and two samples having high modified NP (≥99.5 kg $CaCO_3$/t). Excluding the conveyor samples, all other Left Bank samples submitted for ABA had NPR < 2 and were designated as AG (one sample) or PAG (Figure 2-11). The conveyor samples are NPAG (NPR > 2) when sulphide S is used to calculate the NPR.

Table 2-9:
Summary of 2019 Left Bank ABA Results

Notes:
SAP - Sulphide Acid Potential; TAP - Total S Acid Potential; NPR - Net Potential Ratio
[a]Sulphide S determined by difference [Sulphide Sulphur = (Total Sulphur)-(Sulphate Sulphur)]
[b]NPR is calculated as Modified NP / TAP, except for the 85th Ave Conveyor samples
[c]Rinse pH was done at 1:2 solids to liquid ratio for one of the samples collected in April 2019. When done at 1:1 solids to liquid ratio, sample absorbed all water and no supernatant was formed
[d]NPR is calculated using the non-sulphate sulphur acid potential
Grey shading indicates an NPR < 2.0

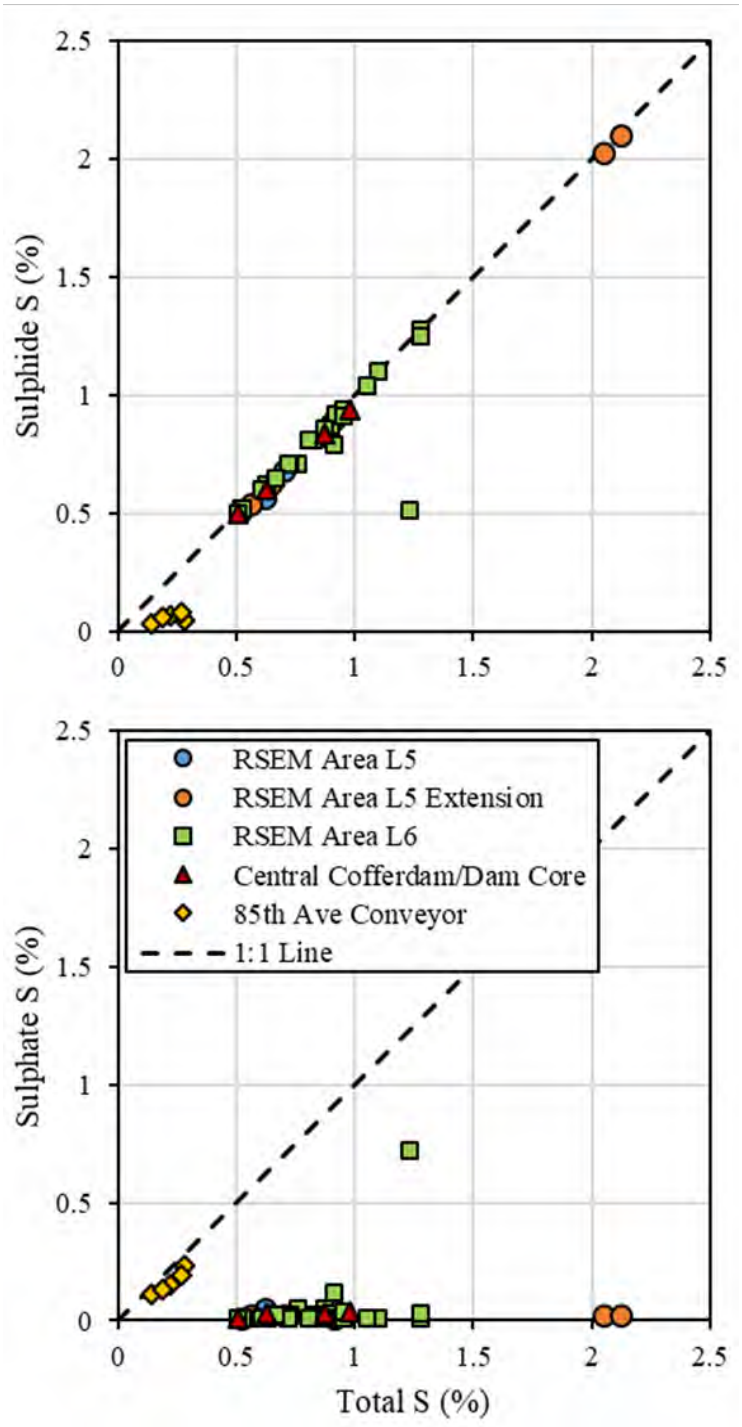

Figure 2-10: Sulphur species *versus* Total Sulphur for 2019 Left Bank samples
Note: Sulphide S is calculated as total S minus sulphate S.

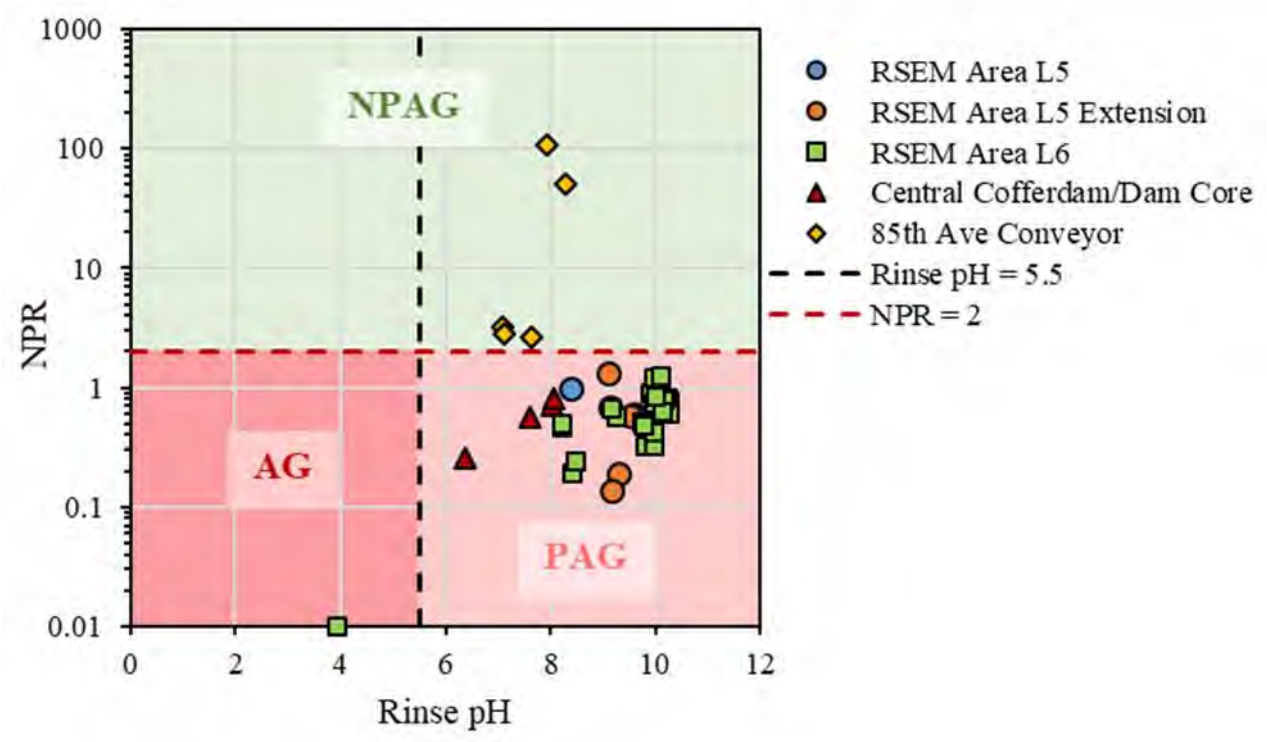

Figure 2-11: NPR *versus* Rinse pH for 2019 Left Bank samples
Note: NPAG: NPR > 2; PAG: NPR ≤ 2; AG: NPR ≤ 2 and rinse pH < 5.5.

Metals and metalloids generally exceeding 3x the ACA give an indication of metal enrichment, and include Ag, As, Au, Bi, Cd, Hg, Mn, Mo, Pb, and Se (Table 2-10). Elements above 3x the ACA in at least 25% of the samples collected in 2019 on the Left Bank include Ag, As, Bi, Cd, and Se. Of these elements, Se contents were often greater than 10x the ACA (18 of 40 samples), while Ag and Cd were greater than 10x the ACA in three samples each. Elements that were rarely above 3x the ACA included Au, Hg, and Pb, which were only above 3x the ACA in one sample each. A similar set of elements were elevated in both the shale samples and the overburden samples collected along the 85th Avenue Conveyor corridor.

There are several factors that influence the leaching rates of elements, including the mineral association and stability, as well as the chemistry of the water in contact with the rocks, ambient temperature, and exposed surface area of the reactive material. Metal enrichment does not necessarily result in metal leaching. Water quality monitoring will continue to screen for these parameters and assess the relationship between solid-phase content of a species and its concentration in drainage.

Table 2-10:
Summary of 2019 Left Bank Solid Phase Metals Results

Element	Units	RSEM Area L5 (n = 4)		RSEM Area L5 Extension (n = 4)		RSEM Area L6 (n = 23)		Central Cofferdam (n = 4)		85th Ave Conveyor (n = 5)

2.4.2.2 Right Bank

Twenty-nine of the 219 samples collected on the Right Bank in 2019 were submitted for further geochemical analyses. This included samples from RSEM Area R5A (n = 7), the Approach Channel (n = 8), the RCC area (n = 4), the Right Bank Dam Core excavation (n = 2), Area 23 (n = 1), and Area A (n = 7). The Area A samples include two shale samples from the excavation and five overburden samples from the Phase 2 Crusher stockpile. A summary of the geochemical results for the Right Bank samples that were submitted for the additional analyses are included in Table 2-11.

The paste pH values range from 2.5 to 9.9 and are generally comparable to the corresponding rinse pH values. The paste pH of three of the RCC area samples and one of the Area A samples were greater than one pH unit higher than the rinse pH values for these samples. This indicates that there may be some stored neutralization capacity within the particle clasts that is released during pulverization.

The total S content of the bedrock samples collected from shale exposures and stockpiles ranged from 0.25% (Right Bank Dam Core) to 2.0% (Approach Channel) (median: 1.1%). Sulphide is the dominant form of sulphur for the majority of these samples and ranges from 0.23 to 2.0% (Figure 2-12). Only three samples from the Approach Channel had a higher proportion of sulphate S relative to sulphide S. The sulphate S is likely related to the presence of an acidic sulphate precipitate. The overburden samples from Area 23 and from the Area A stockpile had lower total S (<0.35%). These samples all have low sulphate S (≤0.020%) and the sulphur balance is dominated by sulphide S (0.030 to 0.32%).

The modified NP was low (<20 kg $CaCO_3$/t) in the bedrock samples while the overburden samples had higher modified NP (Area 23 – 145 kg $CaCO_3$/t; Area A > 80 kg $CaCO_3$/t). The NPR is calculated as the ratio of modified NP to AP. For all Right Bank samples, the AP is calculated using the total S content. To understand the relationship between PAG and currently acidic (AG) material, rinse pH values are plotted against NPR (Figure 2-12). This plot illustrates that the overburden samples from Area 23 and Area A are NPAG and all bedrock samples are AG or PAG. The four AG samples were all collected from the Approach Channel.

Table 2-11:

Notes:
[a]Sulphide S calculated by difference (Total S – Sulphate S)
[b]NPR is calculated as Mod. NP / TAP
Modified NP – Modified Neutralization Potential, NPR – Net Potential Ratio
Grey shading indicates an NPR < 2.0

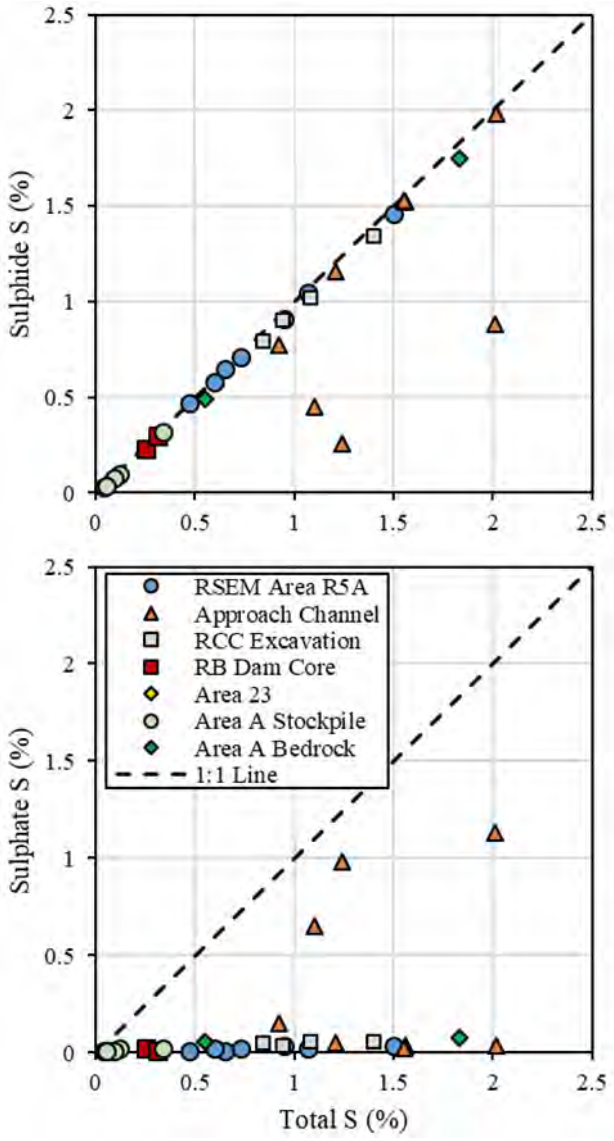

Figure 2-12: Sulphur species *versus* Total Sulphur for 2019 Right Bank samples
Note: Sulphide S is calculated as total S minus sulphate S.

With respect to metals and metalloids, Ag, As, Au, Bi, Cd, Cu, Hg, Mn, Mo, Pb, Sb, Se, and Zn are above 3x the ACA in at least one of the Right Bank samples (Table 2-12). Several of these elements are also above 10x the ACA in at least one of the samples, including Ag, As, Au, Bi, Cd, Cu, Hg, Pb, Sb, and Se; however, only Ag, Cd, and Se are above 10x the ACA in more than 25% of the samples. As stated in the discussion on the Left Bank samples, metal leaching is dependent on a number of factors and metal enrichment does not necessarily imply the potential for metal leaching. The majority of elements that are above 3x the ACA have higher values in the bedrock samples in comparison to the overburden samples. When comparing the median values for all overburden and bedrock samples, the only element with a median greater than five times higher in the overburden samples is Mn (median 462 ppm vs. 81 ppm).

Notes:
Values shaded in light grey exceed 3x the ACA (Average upper continental crustal abundance; Rudnick and Gao, 2014)
Values shaded in dark grey exceed 10x the ACA

One Q2 sample (R5A-2019-APR-17-04) had Au, Bi, Cu, Hg, Pb, and Sb contents above 10x the ACA. In past rounds of sampling, Au, Bi, Cu, Hg, Pb, and Sb, have not typically been elevated above 3x the ACA. No Right Bank samples collected in Q3 and Q4 2019 had Au, Bi, Cu, or Hg above 3x the ACA, indicating that the high values were anomalous in the RSEM Area R5A sample from Q2. One sample collected in RSEM Area R5A in Q4 had Pb and Sb above 3x the ACA; however, the values were considerably lower than in the Q2 sample and there is no indication that the recent excavations are consistently elevated in these elements.

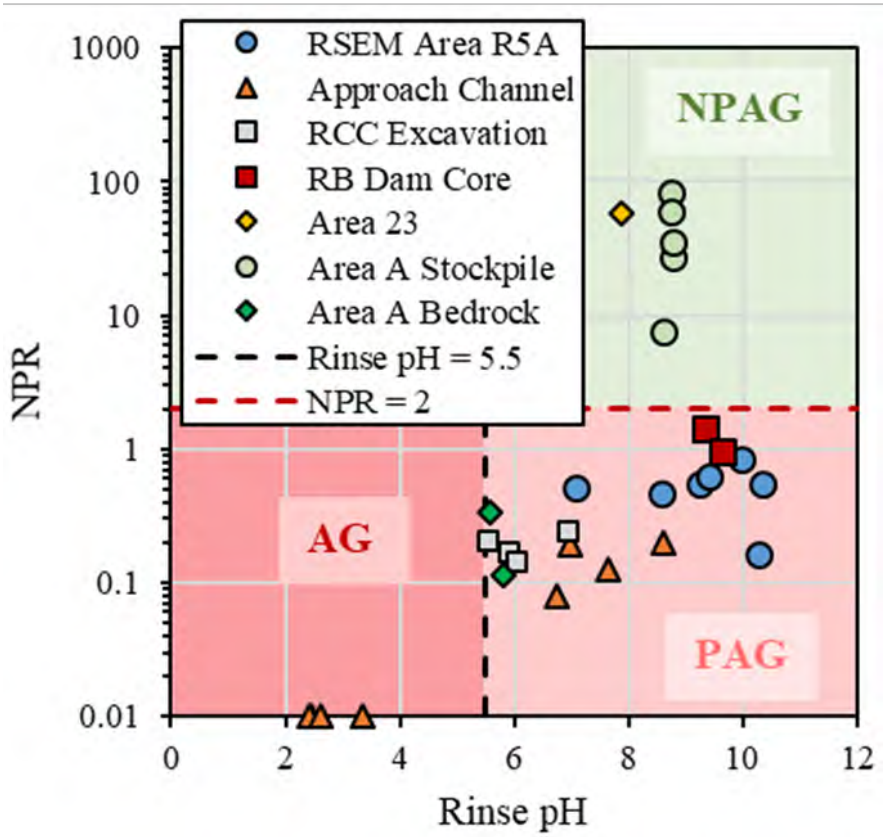

Figure 2-13: NPR *versus* Rinse pH for 2019 Right Bank samples
Note: NPAG: NPR > 2; PAG: NPR ≤ 2; AG: NPR ≤ 2 and rinse pH < 5.5.

2.4.3 Shake Flask Extractions

Shake flask extractions (SFE) were completed on the 13 samples collected from or directly below the Phase 2 Crusher stockpile in Area A (Lorax, 2019c). Metal contents measured in SFE tests provide a measure of the mass of readily soluble metals which will be immediately available for leaching upon exposure to infiltrating water. The procedure consists of agitating a representative sample in water, typically at a water to solids ratio

of 3:1, for 24 hours. The leachate chemistry can be used as a cursory tool in determining the potential leachate chemistry of water in contact with disturbed rock or sediment.

The leachate from the SFE tests was slightly basic (8.58 to 9.07; Table 2-13). The maximum pH falls outside the range specified in the BC freshwater aquatic life water quality guidelines (WQG; BC MOE, 2018). In general, the concentrations of the metals in the SFE leachate remain low and below the BC WQG. The only metals exceeding the BC WQG are Al (all samples) and Sb (one sample). The sample with elevated Sb in the leachate (AREA-A-2019-APR-03) also had the highest solid phase Sb. However, overall, the leachate Sb concentrations and the solid phase Sb contents do not show a strong correlation. These tests indicate that material from the Phase 2 Crusher stockpile is not expected to release elevated concentrations of dissolved metals to the wash waters. As long as there are low concentrations of dissolved metals in the water used to wash the fine material, and no contaminants are introduced from other sources, wash water should not pose significant environmental risk as long as the water is retained in a sediment pond for an adequate period of time to settle suspended solids.

These guidelines apply to total metals, except for D-Al, D-Cd and D-Fe.
[b]Hardness dependent guidelines are based on a hardness of 120 mg/L

3. Surface Water Quality Monitoring

PEACE RIVER
HYDRO PARTNERS

3. Surface Water Quality Monitoring

3.1 Purpose and Objectives

The purpose of the surface water quality monitoring program is to meet PRHP's water quality monitoring requirements for PAG-contact water, which are stated in the BC Hydro and PRHP ARD/ML Management Plans. The specific objectives of the program are:

- To verify water quality predictions;
- To assess water quality within the construction site, including RSEM ponds and upgradient areas that affect them;
- To guide water management and verify the effectiveness of sediment pond operation; and
- To analyze water quality in PAG-containing RSEM sediment ponds that discharge to the Peace River, so as to assess compliance with end-of-pipe discharge limits.

3.2 Monitoring Program and Results

Monitoring and compliance requirements are set out in Sections 7.2, 7.3 and 7.4.2 of the BC Hydro ARD/ML Management Plan. This report addresses the surface water quality monitoring and reporting requirements noted in Section 7.2.2 (RSEM end of pipe water quality), 7.3.2 (PAG containing RSEM material and contact water monitoring) and 7.4.2 (Exceedance Response Plan).

Other requirements are addressed separately. These include requirements related to toxicity (Sections 7.2.1 and 7.3.1 of the BC Hydro ARD/ML Management Plan), Peace River water quality downstream of each RSEM (7.2.3), groundwater below PAG contact RSEMs (7.2.5 and 7.3.3), and Peace River water quality monitoring (7.3.4). These requirements are addressed in other documents.

The aspects of the monitoring program that are addressed in this report are:

- Hourly collection of *in situ* measurements of pH, turbidity and electrical conductivity in each PAG-contact sediment pond;
- Current turbidity and TSS relationships for PAG containing RSEM ponds;

- Daily monitoring of water quality in each PAG containing RSEM (when there is sufficient water in the pond and/or when not frozen); and
- Continuous monitoring of discharge flow from each RSEM sediment pond discharge pipe.

The network of monitoring stations has been adapted as site conditions change. Some stations that were established early in the construction phase are no longer in use. Some new stations have been added. The network of monitoring stations where samples were obtained in 2019 Q3 is discussed in Section 3.2.1 (Left Bank) and Section 3.2.2 (Right Bank).

Analytical measurements are described by station. Measurements included general water chemistry and total and dissolved metals. All analyses were completed by BV at their laboratories in Burnaby, B.C., and Calgary, AB, which are accredited by the Canadian Association for Laboratory Accreditation (CALA) for parameters listed on the Scope of Testing for each facility.

Water quality at stations within the construction site upgradient of RSEM sediment ponds are compared to RSEM end of pipe limits by PRHP to inform water management. Water that accumulates at these stations is not discharged directly to the Peace River. It is conveyed to RSEM sediment ponds, where it mixes with water from other sources, or is trucked to the MWTF if deemed appropriate. Consequently, water quality at these stations that exceeds RSEM end of pipe limits does not indicate non-compliance with RSEM end of pipe limits. It indicates only that water management is required. The RSEM end of pipe discharge limits were derived to protect aquatic life. The stations within the construction site are in water storage or conveyance systems that are generally inaccessible to aquatic life and do not provide habitat. RSEM sediment pond discharge is assessed independently.

Results from PAG-containing RSEM sediment ponds have been compared against the end of pipe (EOP) discharge limits specified in BC Hydro's ARD/ML Management Plan (in the CEMP, Appendix E Rev. 5.2, Section 7, Table 2, page 23), except the RSEM Area R5A ponds which were compared to British Columbia Water Quality Guidelines. The end of pipe limits are reproduced as Table 3-1 for reference.

Table 3-1:
End-of-Pipe (EOP) Discharge Limits for PAG-containing RSEM Sediment Ponds

Parameter	Units	End-of-Pipe Discharge Limit
TSS	mg/L	BC Water Quality Guidelines[1]
pH	pH units	6.0 – 9.0
Cadmium	mg/L	0.00029
Cobalt		0.55
Copper		0.011
Zinc		0.033

1. Approved British Columbia Water Quality Guidelines for the Protection of Aquatic Life (2018)

Available data from other construction areas are compared against the applicable limits shown in the CEMP Rev. 4, Section 4.14 (Surface Water Quality Management), Table 3 (page 62). The information from this table is reproduced below in Table 3-2 for reference.

Table 3-2:
Limits for Construction Areas
Not Specified in Environmental Requirements

Parameter	Maximum Allowable
Suspended solids	• Change from background[1] of 25 mg/L at any one time for a duration of 24 hours in all waters during clear flows or in clear waters • Change from background[1] of 5 mg/L at any one time for a duration of 30 days in all waters during clear flows or in clear waters • Change from background[1] of 10 mg/L at any time when background is 25-100 mg/L during high flows or in turbid waters • Change from background[1] of 10% when background is >100 mg/L at any time during high flows or in turbid waters
Turbidity	• Change from background[1] of 8 NTU at any one time for a duration of 24 hours in all waters during clear flows or in clear waters • Change from background[1] of 2 NTU at any one time for a duration of 30 days in all waters during clear flows or in clear waters • Change from background[1] of 5 NTU at any time when background is 8-50 NTU during high flows or in turbid waters • Change from background[1] of 10% when background is >50 NTU at any time during high flows or in turbid waters
Streambed Substrate Composition	• % fines not to exceed: 10% < 2 mm, 19% <3 mm, 28% < 6.35 mm at salmonid spawning sites • Geometric mean diameter not less than 12 mm (minimum 30-day intra-gravel dissolved oxygen of 6 mg/L) • Fredle number not less than 5 mm (minimum 30-day intra-gravel dissolved oxygen of 8 mg/L)
pH	• 6.5 – 9.0
Oil and Grease	• The surface water should be virtually free of petroleum, animal or vegetable oils

1. Background is the measured concentration for specified parameters in the Peace River

Any analytical results from samples of non-construction contact surface water are compared against approved B.C. water quality guidelines (BC WQGs) for the protection of aquatic life (BC MOE 2018), in accordance with Section 5.2.1.7 of BC Hydro's ARD/ML Management Plan. Water quality guideline values that are calculated as a function of pH, temperature, and/or hardness were derived using the most conservative values per station for the week in which the laboratory results were obtained (minimum pH, hardness and maximum temperature).

Water quality results for the 2019 ARD program are provided in:

- Appendix 3-A –2019 *In situ* Water Quality data (*i.e.*, continuous data obtained from fixed probes);
- Appendix 3-B –2019 Water Quality Analytical Results (tabulated); (including results for RSEM pond discharges);
- Appendix 3-C –2019 Water Quality Field Data; and
- Appendix 3-D –2019 Water Quality Field Blank Data.

The results of the 2019 ARD program are summarized below for the Left Bank (Section 3.2.1) and the Right Bank (Section 3.2.2), followed by an overview of the program Quality Assurance/Quality Control (QA/QC) monitoring results in Section 3.2.3.

3.2.1 Left Bank

Water quality monitoring on the Left Bank was conducted at EOP and upstream locations within the RSEM Area L5, RSEM Area L6, Left Bank cofferdams, LBEX-SP, Area 25 and RSEM Area L3 catchments. The 2019 monitoring stations are listed in Table 3-3 and Table 3-4, and an overview of water quality and management in each catchment area for the Left Bank are presented in the sections below. The monitoring stations are shown in Figure 3-1. Sampling within the catchment areas (Table 3-3 and Table 3-4) was conducted as follows:

- Left Bank Excavation and RSEM Area L5 – analytical samples were obtained from sumps in the LBEX upper benches, and from the RSEM Area L5 East and West sediment control ponds from within the ponds or EOP when the ponds were discharging. Upstream and downstream samples were also collected from Garbage Creek which is directed through culverts and ditches to bypass construction in RSEM Area L5;
- Left Bank cofferdams – analytical samples were collected from sumps and baker tanks that are used collect and manage water within the cofferdams. Residual non-construction surface contact water within the central cofferdam (LBCD) was sampled EOP when discharging to Peace River;

- LBEX-SP – analytical samples were obtained from the LBEX-SP sediment control pond and historic Adit 4;
- RSEM Area L6 – sampling was conducted within the pond or EOP when the pond was discharging; and,
- Area 25 / RSEM Area L3 – analytical samples were obtained from the Area 25 sediment control pond, from within the pond or EOP when the ponds were discharging, and from L3 stream at stations upstream of the Area 25 sediment pond. Several samples of a groundwater seep flowing into L3 stream were also collected.

3.2.1.1 LBEX Sumps

The LBEX sumps are developed along the LBEX benches to collect surface runoff. During 2019, monitoring records indicate water that collected in higher elevation LBEX bench sumps (*e.g.,* LBEX-B2) was directed to the lower elevation LBEX-B1 sump. Dewatering of LBEX-B1 was directed, as needed, to RSEM Area L5 East sediment control pond (January through November), and the RSEM Area L5 West pond (December). Permanent water management structures to convey LBEX runoff to the RSEM L5 ponds are planned.

The LBEX bench sump water quality was circum-neutral with moderate to elevated sulphate concentrations (Table 3-5). TSS was often elevated above 100 mg/L and higher concentrations of Cd, Cu and Zn in several samples are attributed to elevated TSS (*e.g.*, LBEX-B1, maximum values).

Table 3-5:

Notes:
[1]RSEM EOP Limit only applies to RSEM sediment control pond discharges, however the limits are included here for context.
TSS = Total suspended solids.
WQG = BC water quality guideline for aquatic life. The BC WQG for TSS is used as the discharge limit for PAG-containing RSEM pond EOP limits, per the CEMP, Appendix E Rev. 5.2, Section 7, Table 2, page 23. TSS guideline is dependent on background TSS readings in Peace River.

3.2.1.2 RSEM Area L5 Sediment Control Ponds

The lower RSEM Area L5 East and West sediment control ponds collect surface runoff from within the RSEM Area L5 catchment, as well as water transferred from the RSEM Area L5 East Upper sediment control pond, Central Cofferdam sump and LBEX sumps. The ponds are divided by a berm which isolates the two ponds from each other. The berm was designed to allow the cells to merge in a large (greater than 1 in 10 year 24-hour) storm event. The East and West ponds discharge through separate culverts onto a shared rip rap protected outfall, which descends the bank to the Peace River. Two stations have

been established at the pond, one station within the pond itself (the SP station), and another for sampling discharge from the end-of-pipe (the EOP station).

The lower RSEM Area L5 sediment control ponds were completed in Q4 2018 and began discharging in mid-March 2019 during spring snowmelt. Monitoring records indicate the West pond stopped discharging by mid-April and did not discharge for the remainder of 2019, whereas the East pond discharges continued through late November. From late November through December both RSEM Area L5 ponds were managed to maintain low water levels in order to prevent discharge, and site records indicate there was no end of pipe discharge from either pond.

In early May the West pond was temporarily decommissioned in advance of construction. Shortly thereafter, work commenced to realign the northeastern end of the West pond further east, adjacent to the bank of the Peace River, and to construct a haul road bisecting the West pond. Both halves of the West pond are connected through culverts placed under the haul road. During construction, a portion of the West pond was used as a temporary sump for contact water collection from the work area. Residual waters in the West pond, and the temporary sump, were directed to the East pond during decommissioning and construction. After the completion of construction in October low water levels were maintained in the West pond by dewatering to the East pond, as needed. However, site reports indicate minimal to no water accumulation in the West pond, therefore water transfer ceased at the end of October.

A carbon dioxide sparging system was installed and operated in RSEM L5 East sediment control pond, from mid-September through November, to reduce the pH of East pond discharges. In late November, after field monitoring data indicated possible ARD/ML influence in the East pond, water levels were drawn down to prevent discharge by transferring water to the West pond. Dewatering of the LBEX and Central Cofferdam sumps was subsequently directed to the West pond.

Water quality monitoring of RSEM Area L5 East and West sediment control pond waters, and end of pipe discharges, was conducted from January to late July (West pond), and to early December (East pond). Analytical samples and field measurements reported for RSEM-L5-WP-SP, from mid-May through July, were collected from the West pond temporary sump described previously. Instrumentation for *in situ* measurements of pond water quality was deployed when there was sufficient water. The ponds were instrumented from late March to early May, and late March to early December, for the West and East ponds, respectively.

The 2019 analytical data and field pH measurements for RSEM L5 East and West sediment control ponds are summarized in Table 3-6, and plotted in Figure 3-2 through

Figure 3-11. The monitoring data indicate sediment pond waters were circum-neutral to slightly alkaline with typically moderate sulphate concentrations that elevate to 1,000 mg/L in the east pond. TSS in discharges was well managed, and all parameters were within RSEM EOP discharge limits in most analytical samples. TSS was briefly elevated in the East and West ponds during the onset of freshet in mid-March. In September Environmental Monitors noted an increasing pH trend in the East pond, therefore treatment with carbon dioxide was initiated to lower pH in East pond discharges. The treatment was effective, as indicated by the lower field pH measurements observed mid-September onwards (Figure 3-2).

Discharges from the East pond slightly exceeded RSEM EOP limits for Cd in analytical samples collected August 19th, 21st, 22nd, 23rd, and November 21st to 23rd (Figure 3-4). The Cd exceedances followed heavy surface runoff from rain (August) and snow melt (November), and were accompanied by an increase in other ARD/ML indicator parameters (*i.e.*, sulphate, conductivity, Cd, Mn and Zn), particularly in November. It is speculated the heavy runoff events rinsed soluble ARD oxidation products from exposed PAG surfaces into the waters directed to RSEM L5 East pond.

Table 3-6:

3.2.1.3 Garbage Creek Diversion

Garbage Creek diversion runs between RSEM Area L5 and the LBEX area and is isolated from construction activities. The creek water has a natural ARD/ML signature from contact with PAG bedrock as it descends through a small valley to the Peace River, and is conveyed by a pipeline from the inlet culvert upgradient of RSEM Area L5 to the down gradient rip-rap channel that discharges to the Peace River. There was major erosion upstream of the construction site in spring 2018. Since then, the creek is often turbid with

elevated TSS upstream of the Left Bank construction area. From January through September there was intermittent construction at the diversion inlet and discharge channel. During construction, the creek flows were temporarily diverted around the construction areas.

Garbage Creek is non-construction contact surface water. Monitoring records indicate the creek was generally frozen during winter months in 2019. Analytical samples and field measurements were typically collected daily during high flow periods, at upstream and discharge locations, from late-March through November. Analytical samples were tested for turbidity and TSS in 2019. Overall, the Garbage Creek water quality was circum-neutral with elevated turbidity and TSS at all stations (Table 3-7). Excluding the maximum values reported for LBGC-OUT on June 30, for which a corresponding upstream sample was not collected due to unsafe access, the monitoring data indicate the elevated TSS at LBGC-OUT is due to water flowing through the unstable streambed upstream of the Project.

Table 3-7:
Garbage Creek Diversion 2019 Annual Water Quality Summary

Parameter		Field pH	Turbidity	TSS
Units		**-**	**NTU**	**mg/L**
LBGC-Debris-US (n=66 Field pH, 9 Turbidity & TSS)	Min	7.6	28	45.2
	Max	8.8	9880	7200
	Median	8.2	4520	4050
LBGC-0.60 (n=54 Field pH, 25 Turbidity, 28 TSS)	Min	7.1	60.2	1330
	Max	8.6	17500	14700
	Median	8.1	5570	7510
LBGC-OUT (n=231 Field pH, 42 Turbidity, 49 TSS)	Min	7.1	0.38	<4
	Max	8.8	27600 [1]	23300 [1]
	Median	8.3	4375	5400

Notes:
TSS = Total suspended solids
[1] Maximum values were observed June 30, however a corresponding upstream sample was not collected on that day due to unsafe upstream access. Excluding June 30, the maximum values are 17700 NTU (turbidity) and 13800 mg/L (TSS).

3.2.1.4 Diversion Tunnel Inlet Cofferdam

The Diversion Tunnel Inlet Cofferdam (DIC) isolates the Diversion Tunnel Inlet Portal (DTIP) from the Peace River during construction of the parallel diversion tunnels. Contact water and groundwater from tunneling operations are collected at the Diversion Tunnel Inlet Portal (DTIP). The water is collected in Baker tanks (DTIP- BT1, DTIP-BT2) or in sumps (DTIP-1-SUMP, DTIP-2-SUMP and DTIP-DW) and is periodically

transported to the MWTF for treatment prior to discharge through the RSEM Area R5B sediment control pond.

Monitoring data indicate the DTIP waters were acidic in January and circum-neutral the remainder of the year. Moderate to elevated levels above 1,000 mg/L sulphate were observed at all stations except DTIP-BT1, which had low sulphate levels. TSS was generally elevated (above 100 mg/L) and contributed to higher concentrations of Cd, Cu Co and Zn. Monitoring data indicate these waters are PAG influenced and Cd, Cu and Zn were often present in dissolved form, therefore DTIP water was directed to the MWTF for treatment of dissolved metals, as appropriate, in 2019. The monitoring data are summarized in Table 3-8.

Table 3-8:
Diversion Tunnel Inlet Cofferdam 2019 Annual Water Quality Summary

Parameter		Lab pH	Field pH	Conductivity	TSS	Sulphate	T-Cd	T-Co	T-Cu	T-Zn

Notes:
[1]RSEM EOP Limit only applies to RSEM sediment control pond discharges, however the limits are included here for context.
TSS = Total suspended solids.
WQG = BC water quality guideline for aquatic life. The BC WQG for TSS is used as the discharge limit for PAG-containing RSEM pond EOP limits, per the CEMP, Appendix E Rev. 5.2, Section 7, Table 2, page 23. TSS guideline is dependent on background TSS readings in Peace River.

3.2.1.5 Natural PAG Bluff Between DTIP and DTOP

There is an extensive natural shale (PAG) bluff situated between the DTIP and DTOP, below the LBEX. A sediment pond at the base of the bluff (LBEX-SP) was established as

a sump in 2017 to contain runoff from the bluff and drainage from historic Adit 4. Grouting of Adit 4 was undertaken to infill the void beginning in late 2018 and was completed in late January 2019. Site records indicate it no longer produces water. For the first half of 2019, LBEX-SP was intermittently dewatered to RSEM L5 East and RSEM R6 West sediment control ponds, to the DTOP (for use in tunneling operations) and to the MWTF. Runoff from the bluff and the excavation area was managed within the Central Cofferdam for the remainder of 2019.

Monitoring data indicate ADIT 4 and LBEX-SP waters were circum-neutral to alkaline with elevated sulphate. TSS was generally low (<100 mg/L). Higher concentrations of Cd, Cu, Co and Zn are attributed to the dissolved component of these parameters. Sediment pond dewatering was carefully managed and decisions by Environmental Monitors on where to direct the water were informed by monitoring data from analytical samples. Results are summarized in Table 3-9 below.

Table 3-9:
Natural PAG Bluff 2019 Annual Water Quality Summary

Parameter		Lab pH	Field pH	Conductivity	TSS	Sulphate	T-Cd	T-Co	T-Cu	T-Zn

Notes:
[1]RSEM EOP Limit only applies to RSEM sediment control pond discharges, however the limits are included here for context.
TSS = Total suspended solids.
WQG = BC water quality guideline for aquatic life. The BC WQG for TSS is used as the discharge limit for PAG-containing RSEM pond EOP limits, per the CEMP, Appendix E Rev. 5.2, Section 7, Table 2, page 23. TSS guideline is dependent on background TSS readings in Peace River.

3.2.1.6 Central Cofferdam

The Central Cofferdam isolates the Left Bank portion of the dam footprint from the Peace River during excavation and dam construction. In July, after decommissioning LBEX-SP sediment pond, the cofferdam catchment size increased to include runoff from the natural PAG bluff between DTIP and DTOP. Construction of the Left Bank Drainage Adit (LBDA) portal commenced in October. Monitoring records indicate residual non-construction contact water (LBCD-Out) was directed to the stilling basin, adjacent to the Diversion Inlet Cofferdam, for exfiltration to the Peace River from January to mid-

March, after which all water within the Central Cofferdam was managed as PAG-contact water and redirected to the RSEM Area L5 ponds from April through December.

The LBCD-sump was installed in May and sampled approximately weekly through December. Analytical samples were collected from LBCD-Out in Q1, when non-construction contact water was pumped to the stilling basin adjacent to Peace River. The Q1 discharges of LBCD-Out to the Peace River met short term BC Water Quality Guidelines.

All waters in the Central Cofferdam were circum-neutral with variable TSS, and moderate to elevated sulphate concentrations, except the LBDA sample which had low pH and elevated sulphate concentration. Higher concentrations of Cd, Cu, Co and Zn in some samples are generally attributable to TSS, however the dissolved form of these parameters was present in some samples. The strong PAG influence at LBDA portal likely originated from weathered PAG through which the portal was installed. Results are summarized in Table 3-10 below.

Table 3-10:

3.2.1.7 Diversion Tunnel Outlet Cofferdam

The Diversion Tunnel Outlet Cofferdam (DOC) isolates the Diversion Tunnel Outlet Portal (DTOP or DOP) from the Peace River during construction of the parallel diversion tunnels. Contact water and groundwater from tunneling operations were collected in sumps and baker tanks located near the DTOP, and sumps were used in adjacent areas of the DOC to collect surface runoff. The waters collected in the cofferdam were transferred to the MWTF for treatment prior to discharge through the RSEM Area R5B sediment control pond. When hydrosheens were detected, water was collected and disposed at a licenced offsite facility.

The DOC and DOP waters were circum-neutral to alkaline, and sulphate was generally elevated (> 1,000 mg/L) indicating PAG influence in these waters (Table 3-11). Sulphate concentrations were much lower at DOC-S-SUMP and DOP-Fishway-S-Sump. Concentrations of Cd, Cu and Zn generally increased with TSS, except at DOP-BT-WEST where TSS was low (< 100 mg/L), but Cd and Zn were elevated and primarily in dissolved form.

Table 3-11:

Notes:
[1]RSEM EOP Limit only applies to RSEM sediment control pond discharges, however the limits are included here for context.
TSS = Total suspended solids.
WQG = BC water quality guideline for aquatic life. The BC WQG for TSS is used as the discharge limit for PAG-containing RSEM pond EOP limits, per the CEMP, Appendix E Rev. 5.2, Section 7, Table 2, page 23. TSS guideline is dependent on background TSS readings in Peace River.

3.2.1.8 RSEM Area L6 Sediment Control Pond

The RSEM Area L6 PAG stockpile and sediment control pond are located downstream of the future dam alignment, adjacent to the Diversion Tunnel Outlet Cofferdam. The RSEM Area L6 sediment control pond was commissioned in May after the pond discharge infrastructure was installed and instrumented. Prior to commissioning, in late March, the pond was used as a sump for storage of small amounts of water from the Left Bank DIC and DOC areas, and the Right Bank RCC area. The pond has a small catchment and, due to limited water accumulation, the pond did not passively discharge in 2019. In order to evaluate the assimilative capacity of the Peace River adjacent to the sediment pond discharge a controlled mixing study was conducted September 5th by actively discharging (*i.e*., pumping) the RSEM L6 pond water to the Peace River. Following the receipt of the mixing study, BC Hydro approved the pond for discharge on November 22nd. The pond was actively dewatered on December 18th to provide storage in advance of 2020 Spring freshet.

Water quality monitoring of RSEM Area L6 sediment control pond waters was initiated when water accumulated after spring freshet late March and continued at daily or weekly frequency until the pond was dewatered early September. Two additional analytical samples were collected in Q4 prior to the second dewatering in December. Instrumentation for *in situ* measurements of pond water quality was deployed from June through mid-August.

Analytical data and field pH measurements indicate the RSEM Area L6 sediment control pond was circum-neutral to slightly alkaline with moderate sulphate and low TSS concentrations (Table 3-12). The pond water exceeded RSEM EOP limits for Cu and Zn in late March, after small amounts DIC, DOC and RCC waters were stored in the pond, however the pond did not discharge. The elevated Cu and Zn concentrations were due to the dissolved form of these metals, indicating PAG influence, and followed the addition of DIC, DOC and RCC water to RSEM L6. Cu and Zn rapidly declined in April and remained well below limits through December. Discharges from the pond met RSEM EOP limits based on analytical data from an EOP sample (September 5th) and pond water (December 16th). The monitoring data are plotted in Figure 3-12 through Figure 3-16 below.

Table 3-12:
RSEM-L6-SP/EOP 2019 Annual Water Quality Summary

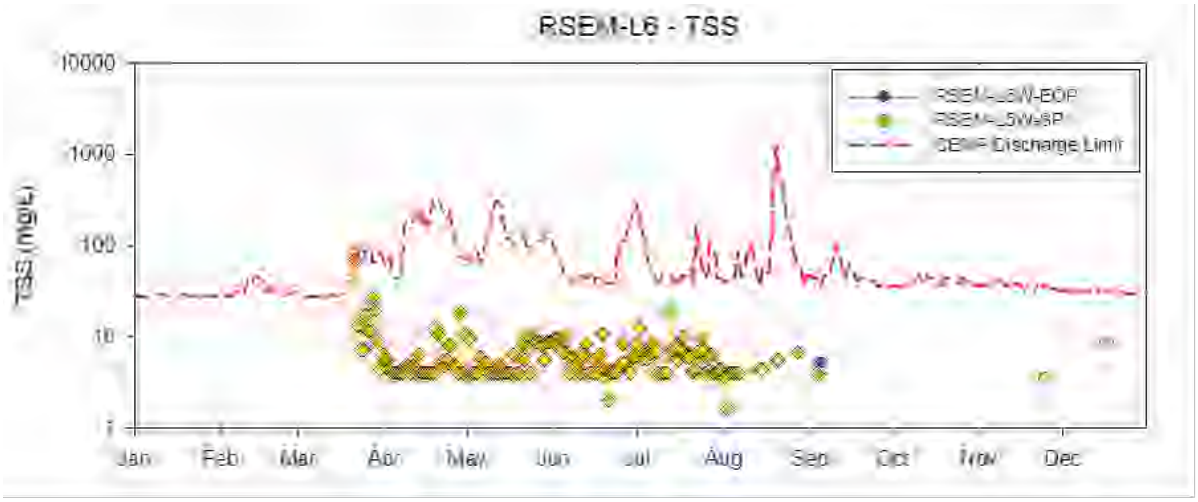

Figure 3-13: Time series profile for total suspended solids (TSS) in RSEM-L6 compared to RSEM EOP Limits. TSS is plotted on a logrithmic scale. EOP – End of Pipe; SP – Sediment Pond.

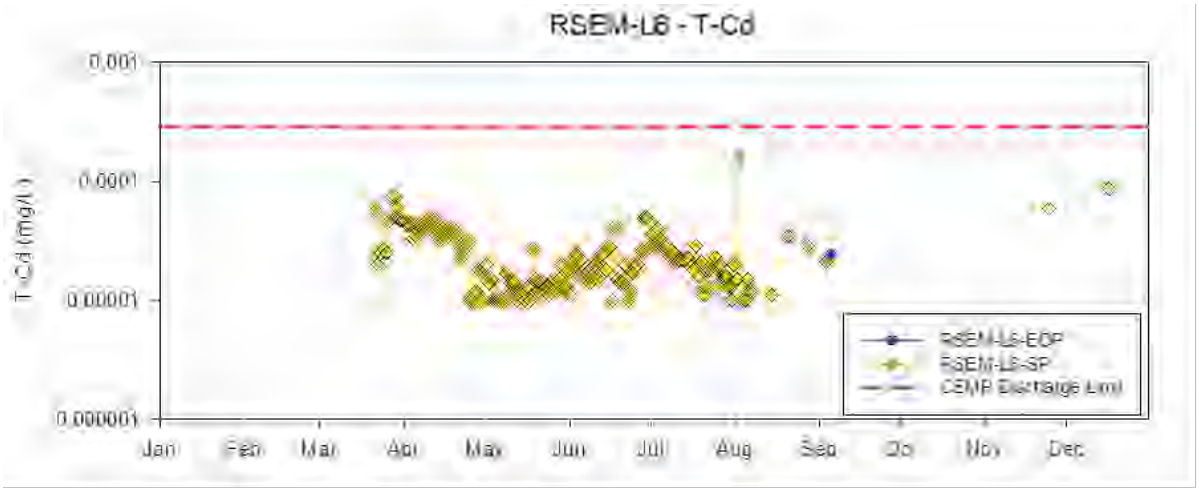

Figure 3-14: Concentrations of cadmium (Cd) for RSEM-L6 compared to RSEM EOP Limits. T-Cd is plotted on a logrithmic scale. EOP – End of Pipe; SP – Sediment Pond; T – Total Concentrations.

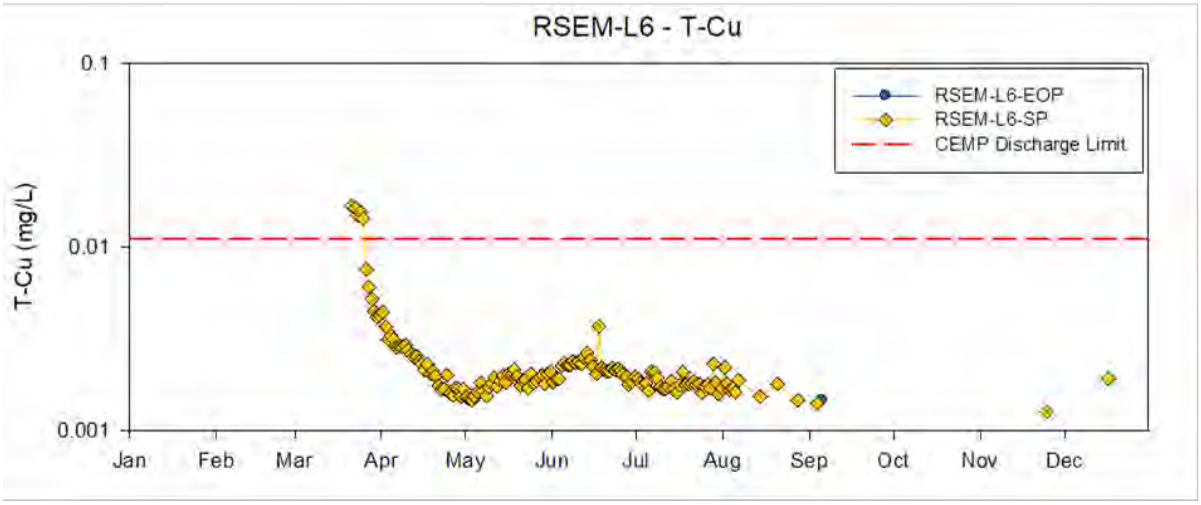

Figure 3-15: Concentrations of copper (Cu) for RSEM-L6 compared to RSEM EOP Limits. T-Cu is plotted on a logrithmic scale. EOP – End of Pipe; SP – Sediment Pond; T – Total Concentrations.

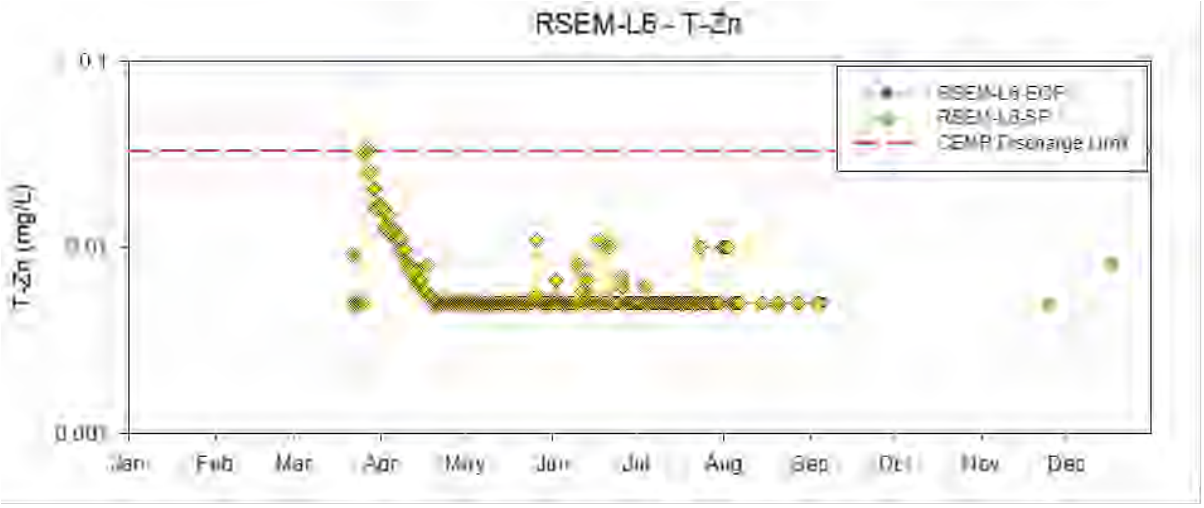

Figure 3-16: Concentrations of zinc (Zn) for RSEM-L6 compared to RSEM EOP Limits. T-Zn is plotted on a logrithmic scale. EOP – End of Pipe; SP – Sediment Pond; T – Total Concentrations.

3.2.1.9 Area 25 / RSEM Area L3

The Area 25 sediment control pond is located on the upper Left Bank adjacent to, and downgradient of, the Two River Lodge camp accommodations, and is situated above the deeply incised L3 stream catchment area. The pond collects non-PAG contact runoff from Area 25 and is designed to exfiltrate to ground but also has an overflow spillway that discharges to L3 Creek.

RSEM Area L3 receives NPAG overburden material, primarily from the LBEX. It is situated along the original course of an unnamed stream (now referred to as L3 Creek). BC Hydro assumed responsibility for this area in mid-2018.

Water quality samples and field measurements were primarily collected early in the year, late March through April when runoff flows were elevated due to spring freshet. The sediment pond and L3 Creek waters were circum-neutral. TSS concentrations were variable in L3 Creek. Area 25 sediment pond discharges, and seepage on the bank of L3 Creek below the pond, were low in TSS relative to analytical measurements at the nearby upstream station on L3 (LBL3C-1.57). Monitoring data are summarized in Table 3-13.

Table 3-13:
Area 25 and L3 Creek 2019 Annual Water Quality Summary

Parameter		Lab pH	Field pH	Turbidity	TSS
Units		**-**	**-**	**NTU**	**mg/L**

	Median	-	7.6	277	326

Notes:
[1]Discharge Limit only applies to Area 25 sediment pond discharges.
TSS = Total suspended solids.
WQG = BC water quality guideline for aquatic life. The BC WQG for TSS is used as the discharge limit per the CEMP Rev. 4, Section 4.14 (Surface Water Quality Management), Table 3, page 62. TSS guideline is dependent on background TSS readings at LBL3C-1. 57.

3.2.2 Right Bank

The water quality monitoring network that was utilized on the Right Bank in 2019 included several stations in Area 30, Area A, RSEM Area R6 and R5B catchments, and at the RSEM R6, R5B and R5A sediment ponds. The station locations and sampling frequencies are listed in Table 3-14 and Table 3-15, respectively. An overview of water quality and management in each catchment area presented in the sections below. The monitoring locations are shown in Figure 3-17 (RSEM Area R5B and RSEM Area R6 catchments) and Figure 3-18 (RSEM Area R5A catchment). Sampling within the catchment areas (Table 3-14 and Table 3-15) was as follows:

- Area 30 – samples were collected adjacent to Septimus rail siding at the storage and transfer area for construction aggregate, and at Area 30 sediment control pond;
- Area A – samples were obtained from ponded water in Area A at the North Ditch and ponded water at the toe of NPAG gravel piles;
- RSEM Area R6 – sampling was conducted at Right Bank Drainage Tunnel (RBDT) Treatment Centre facilities and at several stations within the tunnel. Note that the RBDT Treatment Centre differs from the MWTF in that it is used to settle solids and reduce the elevated pH in water produced during tunnel construction. Samples were also collected from various sumps within the RCC, the AK pond, CVC facilities and the 1500 Pumphouse tank (located at the Peace River pumping station, downstream of the river crossing). Inflow to RSEM R6 EP was sampled at RSEM- R6- EP-US-SD and RSEM-R6-EP-IN. Samples were routinely obtained from RSEM-R6-WP and RSEM-R6-EP, from within the ponds, or EOP when the ponds were discharging;
- RSEM Area R5B - samples were collected from the RBAC Seep and Sump, the RB East Conveyor, historic Adit 3, various sumps within the Approach Channel, the Right Bank Core Trench sump, and the MWTF treated effluent (RB-MWTF-SLP). Daily samples were obtained from RSEM R5B sediment control pond or discharge (RSEM-R5B-SP or RSEM-R5B-EOP); and,
- RSEM Area R5A –Samples were obtained from each of the four RSEM sediment pond cells in RSEM Area R5A in pond or EOP when discharging.

Table 3-14:
Water Quality Monitoring Stations in 2019 (Right Bank)

Station ID	Easting	Northing	Description
AREA 30			
W-SEPTIMUS-HILL	631177	6225853	Located in Area 30 gravel transfer area
AREA 30-EOP	630980	6225761	Area 30 sediment control pond discharge
AREA A			
AREA-A-N-DITCH	631200	6228345	Ditch along the northern edge of Area A
CRUSHER-FEED-PIT-POND-1	631996	6228008	Ponded water in the excavated area at the base of gravel stockpiles, east side
CRUSHER-FEED-PIT-POND-2	632242	6228009	Ponded water in the excavated area at the base of gravel stockpiles, middle pond
CRUSHER-FEED-PIT-POND-3	632491	6228053	Ponded water in the excavated area at the base of gravel stockpiles, west side
CRUSHER-SLP	631234	6228029	Sludge pond adjacent to Phase 2 Crusher settling pond
RSEM AREA R6			
RSEM R6E SUBCATCHMENT – CVC BATCH PLANT			
CVC-BOILER	630194	6228553	Adjacent to CVC plant, within the RSEM Area R6 catchment
CVC-TRUCKS	630212	6228539	Adjacent to CVC plant, within the RSEM Area R6 catchment
CVC-RECLAIMER	630212	6228405	Adjacent to CVC plant, within the RSEM Area R6 catchment
RSEM R6E SUBCATCHMENT – RIGHT BANK DRAINAGE TUNNEL (RBDT)			
RBDT-Station-14177	630006	6228842	Station 14177 inside the RBDT at the portal
RBDT-Station-495	629709	6228974	Station 495 inside the RBDT
RBDT-BT	629972	6228895	RBDT baker tank, beside RBDT and within the RSEM Area R6 catchment
RBDT-MUDPOND	629956	6228997	Baker tank adjacent to RBDT-NSP
RBDT-NSP	629958	6228995	RBDT North Sediment Pond
RBDT-TC	629955	6228905	RBDT treatment centre baker tank
RBDT-TPSA-CP	630067	6228914	RBDT temporary PAG storage area collection ditch
RBDT-TUNNELDUCT	630005	6228827	The tunnel duct outside the RBDT portal
RSEM R6W SUBCATCHMENT – RCC			
RCC-NE-SUMP	629845	6229188	Final sump in RCC area, pH treatment is applied using carbon dioxide sparging
RCC-SPILLWAY-E-SUMP	629746	6229078	Intermediate sump in RCC Spillway area
RCC-SPILLWAY-W-SUMP	629781	6229073	Intermediate sump in RCC Spillway area
RCC-MID-POWERHOUSE	629556	6229216	Intermediate sumps in E-central part of RCC buttress area
RCC-W-SUMP	629607	6229198	Temporary sump west of the RCC area
RCC-SUNKEN-BT	629932	6229078	Sunken Baker Tank for RCC concrete contact water
AK POND	629907	6229011	Lined pond near the RCC
RSEM R6E SEDIMENT POND			
1500-PH-TANK	630566	6229268	Tank that holds river water from the 1500 Pumphouse
RSEM-R6-EP-US-SD	630422	6228901	Ditch along SBIAR Road upstream of culvert
RSEM-R6E-SP	630250	6229153	RSEM R6 East sediment control pond
RSEM-R6E-EOP	630274	6229218	RSEM R6 East sediment control pond end of pipe
RSEM R6W SEDIMENT POND			

Station ID	Easting	Northing	Description
AFDE-POND	630096	6229170	AFDE pond water discharge location
RSEM-R6-WP-IN	630114	6229177	Discharge from RCC_NE-SUMP to west corner of the R6 West Pond
RSEM-R6-WP-W-SUMP	630097	6229170	Sump at western end of the R6 West Pond
RSEM-R6W-SP	630240	6229161	RSEM R6 West sediment control pond
RSEM-R6W-EOP	630273	6229219	RSEM R6 West pond EOP
RSEM AREA R5B			
RSEM R5B SUBCATCHMENT – APPROACH CHANNEL			
AC-EAST-CONVEYOR	629618	6228930	Pooled water north of conveyor
AC-E-SUMP	629228	6229210	Collection sump at the base of the AC excavation, east side
AC-MIXED	629105	6229231	Upper AC ditch upstream from AC East Hairpin sump
AC-E-GW-SUMP	629629	6228939	Collection sump at groundwater seep adjacent to East Conveyor
AC-W-SUMP	629034	6229456	Collection sump at the base of the AC benches, west side
AC-WASHBAY-SEEP	629453	6229051	Groundwater seep west of Tire Truck Washbay
RBAC-SEEP	629594	6228841	Groundwater seep at southeast end of Approach Channel
RBAC-SUMP	629675	6228870	Groundwater sump at southeast end of Approach Channel
R5B-EAST-SEEP	629054	6229762	Ditch line along east of the R5B pond
R5B-WEST-SEEP	628738	6229872	Pooling water at groundwater well GW-6 in RSEM Area R5B
RB-MWTF-SLP	628921	6229604	MWTF Sludge Pond spillway (treated water)
RB-MWTF-SLP-Cell-3	628898	6229617	MWTF Sludge Pond cell 3 (in-pond water)
RSEM R5B SUBCATCHMENT – ADIT 3			
BLEED-GROUT-WATER	629306	6229278	Adit 3 grout bleed water
AREA-32A-SUMP	629258	6229343	Sump for Adit 3 dewatering
ADIT 3	629306	6229278	Historic geotechnical adit
RSEM R5B SUBCATCHMENT – RIGHT BANK CORE TRENCH			
RB-Core-Trench-Sump	629347	6229490	Core trench sump
RSEM R5B SEDIMENT POND			
RB-R5B-ACDC	628917	6229591	Approach Channel ditch above confluence with MWTF discharge
RSEM-R5B-W	628738	6229872	RSEM R5B west ditch
RSEM-R5B-SP	629010	6229803	RESM R5B sediment control pond
RSEM-R5B-EOP	629024	6229796	RSEM R5B sediment control pond end of pipe
RSEM AREA R5A			
RSEM-R5A-NCD	628074	6230275	Eastern end of RSEM Area R5A Non-Contact Ditch
RSEM-R5A-A-SP	628158	6230787	RSEM R5A sediment control pond A
RSEM-R5A-A-EOP	628190	6230802	RSEM R5A sediment control pond A end of pipe
RSEM-R5A-B-SP	628146	6230801	RSEM R5A sediment control pond B
RSEM-R5A-B-EOP	628188	6230803	RSEM R5A sediment control pond B end of pipe
RSEM-R5A-C-SP	627544	6231637	RSEM R5A sediment control pond C
RSEM-R5A-C-EOP	627576	6231660	RSEM R5A sediment control pond C end of pipe

3.2.2.1 Area 30

Area 30 includes the rail loadout facility located on Septimus Hill that that receives, and stockpiles, aggregate from the West Pine Quarry. Runoff is directed to a sediment control pond along the northern edge of Area 30 which discharges to the adjacent wetlands.

A water quality sample was collected in Area 30 of the Right Bank on March 30 to determine whether aggregate from the West Pine Quarry stockpiled in this location may be influencing water quality. The result from the West Septimus Hill sample indicates that Se (0.00014 mg/L) is not elevated. Additionally, sulphate was very low and there was no indication of PAG influence on water quality.

The sediment pond discharge (Area 30-EOP) was sampled mid-March through June. The analytical data and field measurements indicate the discharge was circum-neutral to slightly alkaline. TSS concentrations were variable but were typically below 25 mg/L except late March when TSS increased to 576 mg/L (Table 3-16)

Table 3-16:
Area 30 2019 Annual Water Quality Summary

Parameter		Lab pH	Field pH	Conductivity	TSS	Sulphate	T-Cd	T-Co	T-Cu	T-Se	T-Zn

	Median	-	8.2	-	15.2	-	-	-	-	-	-

Notes:
[1]Discharge Limit only applies to Area 30 sediment pond discharges.
TSS = Total suspended solids.
WQG = BC short-term Water Quality Guideline for aquatic life. The BC WQG for TSS is used as the discharge limit for construction areas not specified in environmental requirements per the CEMP Rev. 4, Section 4.14 (Surface Water Quality Management), Table 3 (page 62). TSS guideline is dependent on background TSS readings in the receiving waters and was assumed to zero.
Red italics indicate a value that exceeds the TSS BC short-term Water Quality Guideline for the protection of aquatic life.

3.2.2.2 Area A

NPAG overburden and aggregate were excavated in Area A, east of the SBIAR. This material was transported to the Phase 2 Crusher to produce aggregate that is temporarily stockpiled for use at the construction site. Water ponds in three low lying areas in eastern side of Area A. Phase 2 Crusher water is directed to a sludge pond to settle TSS, and clarified water is recycled within the crusher circuit. The North Ditch runs along the northern edge of Area A, between SBIAR and the crusher, and receives runoff from the

slope northwest of the crusher. To prevent discharge, North Ditch was periodically dewatered to RSEM Area R6 or RSEM Area R5B sediment control ponds throughout 2019.

Analytical water quality samples were collected monthly from the North Ditch (Area-A-N-DITCH). The Phase 2 Crusher pit ponds and sludge pond were sampled in July. All samples were circum-neutral with low sulphate levels. TSS was generally low (<100 mg/L) and Cd, Co, Cu and Zn were not detected or present at trace levels. The monitoring data indicate the Area A waters were not PAG influenced in 2019. Monitoring data are summarized in Table 3-17.

Table 3-17:
Area A 2019 Annual Water Quality Summary

Notes:
[1]RSEM EOP Limit only applies to RSEM sediment control pond discharges, however the limits are included here for context.
TSS = Total suspended solids.
WQG = BC water quality guideline for aquatic life. The BC WQG for TSS is used as the discharge limit for PAG-containing RSEM pond EOP limits, per the CEMP, Appendix E Rev. 5.2, Section 7, Table 2, page 23. TSS guideline is dependent on background TSS readings in Peace River.

3.2.2.3 CVC Batch Plant

The CVC Batch Plant produces concrete and is located on the northeastern side of Area 21. CVC Boiler and concrete truck wash water is periodically discharged via the SBIAR ditch to the RSEM Area R6 East pond. Water Quality samples were collected in January

from the boiler and a truck, and in April from the CVC Reclaimer. The reclaimer was decommissioned in 2019 and did not discharge.

The CVC waters were circum-neutral to slightly alkaline, with variable sulphate, Cd, Cu and Zn levels. Monitoring data indicate metal concentrations were primarily associated with TSS (CVC-BOILER) or dissolved metals (CVC-RECLAIMER). Results are presented in Table 3-18.

Table 3-18:

3.2.2.4 RBDT Area

The RBDT area is within in RSEM Area R6, south of the sediment control ponds. The area hosts the equipment and facilities needed to support tunneling operations including a treatment centre that removes TSS and reduces pH in tunnel drainage. Water is managed to prevent discharge and is recycled within the RBDT area. The RBDT waters were sampled at various water management locations in the surface and underground facilities with most of the samples collected Q1 through Q3, 2019.

Overall the waters were circum-neutral to alkaline with variable sulphate and TSS levels, depending on sampling location. Samples elevated in TSS had higher concentrations of Cd, Cu and Zn, and monitoring data indicate these parameters were almost entirely attributable to TSS present in the samples. The results are summarized in Table 3-19 below.

3.2.2.5 RCC Area

The future powerhouse, spillway and related facilities are located within the RCC area. Water that accumulated on the floor of the RCC excavation was collected in intermediate sumps and directed to a final sump (RCC-NE-SUMP) where the water was sparged with carbon dioxide to reduce pH. From there water was sent directly to RSEM R6 West sediment control pond, or, at various times, was routed there via AK-POND, where carbon dioxide sparging was also conducted. In late Q4 RCC water was redirected to RSEM R6 East pond. Shotcrete contact water from the RCC Spillway sumps was transferred to the MWTF in Q1.

Water quality samples were collected weekly from the RCC-NE-SUMP, and periodically at other locations. RCC waters were circum-neutral to alkaline with low to moderate sulphate and variable TSS concentrations. Cd, Cu and Zn concentrations increased periodically and were attributable to elevated TSS, except at the temporary RCC-W-SUMP where PAG influence was observed in late Q1 when excess Approach Channel runoff was directed to the sump for storage. The results are summarized in Table 3-20.

Notes:
[1]RSEM EOP Limit only applies to RSEM sediment control pond discharges, however the limits are included here for context.
TSS = Total suspended solids.
WQG = BC water quality guideline for aquatic life. The BC WQG for TSS is used as the discharge limit for PAG-containing RSEM pond EOP limits, per the CEMP, Appendix E Rev. 5.2, Section 7, Table 2, page 23. TSS guideline is dependent on background TSS readings in Peace River.

3.2.2.6 RSEM Area R6 Sediment Control Ponds

The RSEM Area R6 East and West sediment control ponds are divided by a berm which isolates the two ponds from each other. The berm was designed to allow the cells to

merge in a large (greater than 1 in 10 year 24-hour) storm event. The East and West ponds discharge through separate culverts onto a shared rip rap protected outfall, which descends the bank to the Peace River. Two stations have been established in each pond, one station within the pond itself (the SP station), and another for sampling discharge from the end-of-pipe (the EOP station). The EOP station is sampled when the pond is discharging.

In 2019, the RSEM Area R6 East sediment control pond received surface runoff and periodic discharges from the CVC Batch Plant via the SBIAR ditch, as well as water transferred from RSEM R6 West pond, Area A North Ditch and the RCC area. In early June, the 1500 Pumphouse tank, located near the Peace River adjacent to the RSEM Area R6, was emptied and directed to the RSEM R6 East pond. In mid-June a carbon dioxide sparging system was installed to reduce pH levels in East pond EOP discharges. From January through mid-March the East pond was intermittently dewatered to the MWTF to prevent discharge.

From January through mid-September RSEM Area R6 West sediment control pond received water from RCC, AK Pond and Area A North Ditch. A small amount of water from the AFDE Pond was discharged to the West pond early April. The pond was intermittently dewatered to the MWTF January through mid-March to prevent discharge. Small volumes of water were discharged late January following a brief period snowmelt when runoff flowed along the surface of the pond ice cover to the discharge pipe. From mid-September onwards the RSEM R6 West pond was managed to maintain low water levels by pumping to the East Pond, and in December, water from the RCC area was redirected from the West pond to the East pond. Monitoring records indicate the RSEM R6 West Pond did not discharge mid-September through December.

Water quality monitoring of RSEM Area R6 East and West sediment control pond waters, and EOP discharges, was conducted throughout 2019. Instrumentation for *in situ* measurements of pond water quality was deployed throughout 2019 at the East Pond and until mid-December in West Pond.

RSEM Area R6 East Catchment

Analytical water quality data and field pH measurements for RSEM R6 East pond stations are summarized in Table 3-21 and trends in water quality in the east sediment pond are illustrated in Figure 3-19 through Figure 3-23.

The 2019 monitoring data indicate the RSEM Area R6 East sediment control pond waters and EOP discharges were circum-neutral to slightly alkaline, with sulphate concentrations less than 420 mg/L. From January to mid-March, Zn concentrations from the East pond water samples occasionally exceeded the RSEM EOP discharge limits,

however inflows were low, and the pond was actively dewatered and did not discharge over this period. In mid-June Environmental Monitors noted an increasing pH trend in the East pond, therefore treatment with carbon dioxide was initiated, and used as needed to lower pH in East pond discharges. The treatment was effective as indicated by the lower field pH measurements observed mid-June onwards (Figure 3-19). Overall, TSS was well controlled and RSEM R6 East pond discharges met RSEM EOP limits for all parameters, except on June 29th (Zn) and November 26th (Cd). In both instances Zn and Cd concentrations were low in the days prior to, and immediately after, the exceedance.

East pond influent waters at RSEM-R6-EP-US-SD (the inlet to the RSEM R6 East pond catchment) and in the 1500-PH-TANK were circum-neutral, with low sulphate levels and variable TSS concentrations. Concentrations of Cd, Cu and Zn at RSEM-R6-EP-US-SD are attributed primarily to TSS, and to a lesser degree, dissolved metals (Zn).

Table 3-21:

RSEM Area R6 West Catchment

Results for RSEM R6 West pond stations are summarized in Table 3-22 and water quality trends from the West sediment control pond and the end of pipe discharge are illustrated in Figure 3-24 through Figure 3-28.

The 2019 monitoring data indicate the RSEM Area R6 West sediment control pond waters and EOP discharges were circum-neutral to slightly alkaline, with sulphate concentrations less than 330 mg/L. From January to mid-March, Cu and Zn concentrations from the West pond water samples occasionally exceeded the RSEM EOP discharge limits, however the pond did not discharge over this period. Exceedances of the RSEM EOP limit were observed in RSEM R6 West sediment control pond discharge on January 30th (Cu, Zn), June 29th (Zn), July 6th (field pH) and August 16th to 18th (TSS). Concentrations typically declined after the exceedance, except in Q1, when the ponds were not regularly discharging due to low inflows and active dewatering. The Cu and Zn exceedances are attributable primarily to dissolved forms of these metals and to a lesser degree, TSS (June 29th).

In the RSEM R6 West pond area, AFDE-POND and RSEM-R6-WP-W-SUMP water quality is characterized as circum-neutral with moderate TSS and low sulphate, Cd, Cu and Zn concentrations. Water pumped from RCC (RCC-NE-SUMP) was discharged to RSEM R6 West pond at RSEM-R6-WP-IN. The water was circum-neutral to alkaline, with sulphate concentrations less than 275 mg/L. However, concentrations of Cd, Cu and Zn often increased in association with increases of TSS up to 7,000 mg/L.

3.2.2.7 Approach Channel

Located on the PAG bench south of the Right Bank Cofferdam, the Approach Channel area extends from Area 21 northwest to RSEM Area R5B. The PAG bedrock slope facing the Right Bank Core Trench (RBCT) excavation was partially excavated in previous years exposing fresh PAG surfaces.

In 2019, surface runoff and groundwater seepage were intercepted with a network of sumps, ditches and active water management (*i.e.*, pumps, hoses and water trucks). Groundwater seepage from the Approach Channel and Right Bank Core Trench (RBCT) excavation was routed to the intermediate AC East Hairpin sump. From there, water was re-directed to the MWTF or RSEM R5B sediment control pond, as appropriate. PAG-contact surface runoff within the Approach Channel was collected in sumps and transferred directly to the MWTF. At the end of Q1, when PAG-contact water flows increased in response to freshet snowmelt, surplus Approach Channel water was conveyed to the temporary RCC-W-SUMP for storage.

Water quality samples were typically collected monthly from AC-E-Sump, AC-W-Sump and AC-E-GW-Sump, RBAC-SEEP, RBAC-SUMP, RB-R5B-ACDC, and periodically at other locations. Water quality stations are grouped together as sub-areas and described below. Results are summarized in Table 3-23.

The upper Approach Channel stations (RBAC-SEEP, RBAC-SUMP, AC-Mixed) were typically circum-neutral (except Jan sample from RBAC-SUMP) with to moderate sulphate concentrations. TSS is typically low (<100). Concentrations of Cd, Cu and Zn were variable and occasionally due to TSS, but generally associated with dissolved metals.

At the downslope East Conveyor stations (AC-E-Conveyor and AC-E-GW-SUMP) water quality was typically circum-neutral, except an AC-E-Conveyor sample collected in March which was low pH (3.4). Sulphate was variable and elevated to 990 mg/L at AC-E-GW-SUMP and 1,220 mg/L at AC-E-Conveyor. TSS was typically below 100 mg/L and Cd, Cu, Zn were elevated in AC-E-Conveyor and generally low in the AC-E-GW-SUMP, and were usually associated with dissolved metals.

Along the base of the excavated PAG benches, the AC-E-SUMP and AC-W-SUMP were circumneutral with moderate sulphate concentrations except at AC-E-SUMP collected late March (11,300 mg/L). TSS was low and Cd, Cu, Zn were variable and typically associated with dissolved metals. A single sample collected from the AC-Washbay-Seep was alkaline, with low concentrations of sulphate, TSS, Cd, Cu and Zn.

Approach Channel water directed to RSEM R5B sediment control pond is monitored at RB-R5B-ACDC, upstream of the MWTF-SLP discharge. In 2019, the water was circum-neutral, and sulphate concentrations were low to moderate. TSS was variable. Concentrations of Cd, Cu and Zn were typically low, elevated concentrations are associated with TSS (March 8th) and dissolved metals (April 2nd).

Notes:
[1]RSEM EOP Limit only applies to RSEM sediment control pond discharges, however the limits are included here for context.
TSS = Total suspended solids.
WQG = BC water quality guideline for aquatic life. The BC WQG for TSS is used as the discharge limit for PAG-containing RSEM pond EOP limits, per the CEMP, Appendix E Rev. 5.2, Section 7, Table 2, page 23. TSS guideline is dependent on background TSS readings in Peace River.

3.2.2.8 Adit 3

Located west of the RCC area at the base of the Approach Channel bench, historic Adit 3 is a former geotechnical exploration adit that is required to be plugged in advance of dam construction. Installation of the grout plug commenced Q2, 2019. Drainage from Adit 3 accumulated in AREA-32A-SUMP, and later the sump was replaced by baker tanks. Water quality samples were collected Q2, 2019.

The bleed grout water was alkaline, with elevated TSS, sulphate, Cd, Cu and Zn. Ammonia and TOC were also elevated (data not shown). Adit 3 drainage was similarly elevated, except the waters were circum-neutral and TOC was not present. The AREA-32A-SUMP had the lowest concentrations and was circum-neutral. Results are presented in Table 3-24. Water from AREA-32A-SUMP was transported off site for disposal at a licensed facility.

Table 3-24:

TSS = Total suspended solids.
WQG = BC water quality guideline for aquatic life. The BC WQG for TSS is used as the discharge limit for PAG-containing RSEM pond EOP limits, per the CEMP, Appendix E Rev. 5.2, Section 7, Table 2, page 23. TSS guideline is dependent on background TSS readings in Peace River.

3.2.2.9 Right Bank Core Trench

The Right Bank Core Trench excavation commenced in 2019 within the Right Bank Cofferdam. Water from groundwater seeps and surface runoff accumulated on the floor of the excavation. PAG-contact water was conveyed to the MWTF and groundwater was directed to RSEM R5B Sediment Control Pond or the MWTF via the intermediate Approach Channel East Hairpin sump.

Groundwater seepage on the floor of the Core Trench excavation accumulated in the RB-Core-Trench-Sump. A water quality sample collected in August was alkaline with a sulphate level of 160 mg/L and elevated TSS (above 100 mg/L). Copper and Zn concentrations are associated with TSS rather than an ARD signature. Results are shown in Table 3-25.

Table 3-25:

3.2.2.10 Mobile Water Treatment Facility

The MWTF facilities are located on the western end of the Approach Channel area. The Mobile Water Treatment Facility (MWTF) received PAG-contact water from the Approach Channel and other catchments in the Project area (RSEM Areas R5A and R6 sediment control ponds, LBEX-SP, DIC/DTIP, LBCD, DOC/DTOP, RCC and RBCT) as directed by site Environmental Monitors and based on field measurements and analytical data. The MWTF is used to treat PAG contact water to meet the RSEM discharge limits. Treated water discharges through a series of three sludge collection cells to settle solids and is sparged with carbon dioxide to reduce pH. The clarified water passively discharges from Cell 3 at a rate of 3 - 10 L/s via the lower Approach Channel Diversion Channel (ACDC) to the RSEM Area R5B sediment control pond. Sludge was periodically removed from the collection cells and disposed of off-site at a licensed facility or in RSEM Area R5A.

The MWTF treated effluent was monitored weekly at the sludge pond spillway (RB-MWTF-SLP) from April through August, and monthly thereafter. In February, a sample was collected from within the sludge pond (RB-MWTF-SLP-Cell-3), upstream of final pH adjustment. The in-pond sample was alkaline and elevated Cu, Cd and Zn were associated with TSS. Discharge from the pond was circum-neutral and concentrations of sulphate were moderate and elevated to 1,650 mg/L. Concentrations of TSS, Cd, Cu and

Zn were low or below the analytical detection limit. Results are summarized in Table 3-26.

Table 3-26:

3.2.2.11 RSEM Area R5B Sediment Control Pond

The RSEM Area R5B sediment control pond is located adjacent to the northwest portion of the Right Bank Cofferdam. The pond passively discharges through a pipe to a rip rap protected outfall, which descends the bank to the Peace River. Two stations have been established at the pond, one station within the pond itself (the SP station), and another for sampling discharge from the end-of-pipe (the EOP station).

The RSEM Area R5B sediment control pond received water from several sources in 2019. These include groundwater from seeps in the Approach Channel and Core Trench Excavation areas, and MWTF treated effluent that was routed to RSEM R5B pond through the R5B ACDC Ditch, and surface runoff from RSEM-R5B-W ditch. Area A North Ditch water was periodically transferred to RSEM R5B pond throughout 2019. During heavy surface runoff from snowmelt or precipitation, untreated waters from the Approach Channel and Core Trench excavation were frequently monitored by site staff for PAG-influence in the sumps and ditches used to convey water from the Approach Channel to the RSEM R5B sediment control pond. If an increasing PAG-influence trend was measured, these waters were redirected to the MWTF to treat for dissolved metals prior to discharge through the RSEM Area R5B pond.

The RSEM R5B pond discharged most days in 2019, except early February and early March, when the discharge pipe was blocked by ice for several days and discharges stopped until the ice blockage was removed, and from August 29 through September 11 when the RSEM R5B pond was temporarily dewatered and dredged to remove sediments that accumulated in the pond. While dredging, the MWTF Sludge Pond treated effluent was pumped directly to the RSEM R5B pond discharge. The sediment pond dredgeate was permanently stored in RSEM Area R5A. Sparging with carbon dioxide was implemented early May to reduce elevated pH in RSEM R5B EOP discharges. Instrumentation for continuous *in situ* measurements of pond water quality was deployed throughout 2019, except in Q3 when the pond was dewatered for dredging.

Water quality sampling was conducted throughout 2019 at the RSEM R5B sediment control pond, and once late-October at RSEM-R5B-W ditch. All waters were circum-neutral to slightly alkaline. A TSS concentration of 4,260 mg/L at RSEM-R5B-W produced elevated Cd, Cu and Zn concentrations relative to the sediment control pond concentrations. In contrast, the RSEM R5B sediment control pond typically had low TSS, Cd, Cu and Zn, however, when detected, the metals were often present in dissolved form and not attributable to TSS. Discharge from the pond met RSEM EOP limits, except on the dates indicated below.

The R5B-EAST-SEEP, R5B-WEST SEEP samples collected in May were circum-neutral. Concentrations of sulphate were below 600 mg/L and TSS was below 10 mg/L. Cadmium, Cu and Zn concentrations were low in the West Seep, elevated in the East Seep, and are attributed to dissolved metals. Water quality results are summarized in Table 3-27, and Figure 3-29 through Figure 3-33.

Exceedances of the RSEM EOP limit were observed at RSEM R5B sediment control pond discharges March 14th through 21st (TSS, Cd, Cu, Zn – varied by day), with the metal exceedances primarily attributable to TSS. The August 22nd to 24th exceedances (Cd, Zn - varied by day) are attributable to dissolved Cd and Zn. Concentrations rapidly declined below the discharge limits following each exceedance period.

Table 3-27:

3.2.2.12 RSEM Area R5A Sediment Control Ponds

The RSEM Area R5A sediment control ponds receive surface runoff from within the RSEM Area R5A footprint which extends roughly 2 km from northwest to southeast. A diversion ditch intercepts non-contact water originating upgradient of the RSEM Area R5A and conveys this water to the Peace River. The four sediment control ponds associated with this RSEM Area were constructed in 2017 and have been in use since 2018. Two ponds extend over the length of the southeastern half (ponds A and B) of the

RSEM area, and two run the length of the northwestern half of the RSEM area (ponds C and D). Outfalls have been constructed that convey discharge from the southeast ponds into a riparian area adjacent to the river (ponds A / B) and from the northwest ponds to a side channel of the Peace River (ponds C / D). There are two water quality monitoring stations at each pond one station within the pond itself (the SP station), and another for sampling discharge from the end-of-pipe (the EOP station).

The RSEM Area R5A sediment control ponds have not been authorized for direct passive discharge to Peace River. In 2019, the ponds were managed to maintain waters levels below 50% of the discharge elevation by pumping water between the RSEM R5A ponds and by dewatering and transporting water to the RSEM R5B pond (late Q1/early Q2) and the MWTF (balance of 2019). However, in late Q1, rapid snowmelt led to runoff inflows that exceeded dewatering rates. Monitoring records indicate that, collectively, RSEM R5A ponds A, B and C discharged 2,337 m^3 in 2019 (March 18th to March 22nd) a relatively small volume compared to the over 900,000 m^3 combined discharge from the PAG-containing RSEM sediment control ponds on the Right and Left Banks (Section 1.5.2). Pond D did not discharge.

Water quality samples were collected from the RSEM R5A ponds in Q1 and Q2 at in-pond and EOP stations. The diversion ditch (RSEM-R5A-NCD) was sampled once during Q1. Pond water quality was screened against British Columbia Water Quality Guidelines (BC WQG), with short-term guidelines applied to ponds A and B and long-term guidelines applied to ponds C and D. In addition to parameters with an RSEM-EOP limit, only results for parameters which exceeded the BC WQG are included in Table 3-28 and Table 3-29

Overall, RSEM Area R5A sediment control ponds A through D, and RSEM-R5A-NCD, were circum-neutral to alkaline pH with low sulphate concentrations that, in late Q1, elevate to 696 mg/L (pond B) and 1,460 mg/L (pond C). TSS was variable ranging from 21 to 2,680 mg/L. Elevated concentrations of Cd, Cu and Zn were associated with TSS. Discharges from the RSEM R5A ponds were below BC WQG except for the parameters discussed below.

The EOP discharges from RSEM R5A ponds A and B, and diversion ditch water (RSEM-R5A-NCD), exceeded short-term BC WQG March 18th to 21st (pond A), March 19th to 21st (pond B) and March 19th (RSEM-R5A-NCD) for some or all of the following: TSS, T-Ag, T-As, T-Cu, T-Fe, T-Mn and T-Zn (Table 3-28). The long-term BC WQG were exceeded for TSS, T-As, T-Co, T-Cu, T-Fe, T-Pb, T-Se and T-Zn at RSEM R5A pond C EOP, March 19th to 21st (Table 3-29).

Table 3-28:

Notes:
[1]RSEM EOP Limit only applies to RSEM sediment control pond discharges, however the limits are included here for context.
[2]Approved BC long-term Water Quality Guideline for protection of aquatic life. Calculated guidelines (*i.e.*, those based on hardness, pH, temperature or chloride levels) are based on the minimum data statistic measured at the stations in Q3 2019. Temperature of 15°C assumed.
TSS guideline is dependent on background TSS readings in Peace River.
Red italics indicate a value that exceeds BC long-term water quality guidelines for the protection of aquatic life. Because calculated guidelines shown are based on corresponding minimum hardness statistic, discrepancies may exist between exceeding values shown in table and reported exceedances.
RSEM EOP limits are presented for context only, the data are not screened against these limits.

3.2.3 Quality Assurance and Quality Control

A quality assurance / quality control (QA/QC) program has been developed and implemented for ARD/ML related surface water quality monitoring for PRHP's Main Civil Works contract. It is intended to validate monitoring data, and to identify potential deficiencies of the monitoring program. The QA/QC program is described in more detail in Appendix 3-E.

This section summarizes the results of the QA/QC program for 2019. The program included an evaluation of field blanks, replicate samples, total *vs*. dissolved metal, hold time exceedances and comparison of field, continuous data logger (*in situ)* and lab measurements for key parameters, further described below. The British Columbia Field Sampling Manual (BC ENV, 2013) indicates QA/QC samples (*e.g.,* blanks and duplicates) should typically constitute 20% to 30% of the water quality samples obtained as part of the monitoring program. A total of 619 QA/QC samples were obtained (302 blanks and 317 duplicates) in 2019 out of a total set of 2760 samples collected as part of the ARD water quality monitoring program (including blanks and duplicates). QA/QC samples therefore represented approximately 22% of total samples collected, within the 20% to 30% range outlined in the BC Field Sampling Manual.

The analytical laboratory, BV Labs, was instructed to screen water quality data against RSEM pond discharge limits starting in Q1 of 2017, where applicable, and to issue exceedance notifications at the time of reporting. This approach has been useful to ensure rapid detection of potential exceedances in site or discharged water, particularly as the number of discharge locations has increased as construction has extended over a greater area.

3.2.3.1 Blanks

A total of 302 field blanks were collected as part of the 2019 surface water quality monitoring program (Appendix 3-C). These data indicate good overall contamination control, with the majority of parameter values (98%, not including pH, which is always detectable) in blank samples falling below the laboratory reported detection limit (RDL) as shown in Table 3-30. In total, 87 parameter values out of the 27, 395 measured (*i.e.*, 0.3%) were greater than the data quality objective (DQO) of 2-times the RDL. The proportion of parameters exceeding the DQO ranged from 0.1% to 0.5% per quarter.

Parameters which account for the greatest occurrence of DQO failures include turbidity, sulphate, Al (total or dissolved), Ca (total or dissolved) and DOC (Table 3-31). The majority of these anomalies may be attributed to minor environmental sources or contributions associated with the laboratory materials (*e.g.,* DI water, laboratory bottles)

and sampling procedure. Overall, parameters detected in field blanks rarely occurred at concentrations observed in ARD monitoring samples. Further, parameters for which end-of-pipe discharge limits exist were rarely detected in field blanks. Therefore, 2019 results for field blanks are not suggestive of measurable or systemic contamination that could affect the interpretation of environmental monitoring data.

Table 3-30:
Comparison of number and type of detected parameters in field blanks in 2019

Quarter	Number of Field Blanks Collected	Number of Parameters Analyzed in Field Blanks	Number of Detected Parameters > RDL	Number of Detected Parameters > 2x RDL	Top Parameters with Detected Values > 2x RDL (Number of Times)
1	37	3,316	61	9	Turbidity, T-Hg (2); HCO_3, SO_4, T-Al, D-Ca, D-Hg (1)
2	85	7,650	115	27	Ammonia (5); Cl, TDS (3); T-Al, D-Al (2)
3	89	8,151	148	44	DOC (20); SO_4 (6); T-Ca, T-Mo, D-Mo (3)
4	91	8,278	81	7	DOC (4); Turbidity (3)

Notes: RDL- Reported Detection Limit

3.2.3.2 Field Duplicates

A total of 317 field duplicates were collected as part of the 2019 surface water quality sampling program. In general, water quality results were generally similar between field duplicates. Table 3-31 shows the number of duplicates containing parameters with Relative Percent Difference (RPD) values greater than the acceptability criteria of 20% and 50% (calculated only if the reported parameter value was greater than five-times the RDL in at least one of the sample duplicates). Overall, the relative proportion of analyte pairs with RPDs greater than 50% was low throughout the program, ranging from 0.2% to 0.4%, with exception to Q2, to be discussed in greater detail below. Parameters that show the highest variability between samples include nitrogen species, TOC, chloride, turbidity, T-Al, T-Fe, T-Mn, T-Ni and T-Zr. In general, these parameters are similar to those flagged in previous annual reports.

In Q2, the proportion of parameters exceeding an RPD of 50% was 1.2%, higher than in other quarters in 2019 (Table 3-31). Three duplicate pairs suspected of being mislabeled were collected in May and account for the majority of parameters not meeting the acceptability criteria. These include RSEM-L5E-EOP collected on May 19th; RSEM-L5E-EOP collected on May 29th; and RSEM-L6-SP collected on May 20th. There has been no confirmation of labelling errors either in the field or at the lab during analysis of these samples; thus, the findings of this investigation remain inconclusive.

Of the parameters for which end-of-pipe discharge limits are approved (Cd, Co, Cu, TSS, Zn, and pH), four duplicate pairs for T-Cu, two for TSS and one for T-Co and T-Cd had RPD values greater than 50% in 2019 (Table 3-32). In all cases, the measured concentrations of each parameter fell below the RSEM end-of-pipe discharge limit.

Variability in concentrations between field duplicates may be attributed to environmental heterogeneity at the pond sampling location, minor changes to sample composition after collection, or potential sample contamination. Such variability is not expected to measurably alter the interpretation of the data.

Table 3-31:
Comparison of duplicate and parameter counts with RPDs greater than 20% and 50% by quarter

Quarter	Total Number of Duplicates	Total Number of Parameters Analyzed in Duplicates	Number of Parameters with RPD > 20%	Number of Parameters with RPD > 50%
1	39	3,535	47	15
2	94	8,539	236	103
3	92	8,520	76	29
4	92	9,298	89	17

Notes: RPD- Relative Percent Difference

Table 3-32:
Comparison of 2019 duplicate RPDs greater than 50% for parameters with end-of-pipe discharge limits

Quarter	Station Code	Collection Date	Parameter	Concentration (mg/L)			RPD (%)
				RDL	Sample	Duplicate	
2	RSEM-L5W-SP	17/04/2019	T-Cu	0.0005	0.00152	0.00261	53

Notes: **RDL- Reported Detection Limit**

3.2.3.3 Total versus Dissolved Metals

Out of 85,542 total and dissolved parameter pairs compared in the 2019 dataset, 293 dissolved metal values were flagged as being higher than their corresponding total metal value (0.34%) (Table 3-33). Overall, this proportion was higher in the first quarter (0.61%) and similar through Q2 to Q4 (0.22% to 0.30%). Dissolved parameters that most frequently exceeded their total values were K, Li, Mo, Sb and Si. These parameters are consistent with those reported in previous annual reports.

For the purpose of the present data evaluation, a second data quality objective of 150% was also used to identify parameters with the greatest magnitude of exceedances (Table 3-31). The proportion of dissolved parameters that exceed the secondary DQO is low and range from 0.01% to 0.13% per quarter. There is no direct explanation for this variability across quarters; however, high TSS events have in some cases coincided with the occurrence of dissolved parameters exceeding total values. In general, Mo and Sb account for the majority of flagged values, which may indicate that values reported for these parameters may be associated with a higher degree of uncertainty. Overall, these results reflect a reasonable confidence in the data.

Table 3-33:
Number of Sample Metal Pairs in 2019 for which the Dissolved Concentration Exceeded the Total by 120% and 150%

Quarter	Total Number of Sample Collected	Number of Parameters with D>120% T	Number of Parameters with D>150% T
1	524	109	24
2	894	91	29
3	612	45	10
4	488	48	2

3.2.3.4 Hold Time Exceedances

PRHP makes every effort to have samples delivered to BV Labs within recommended hold times, and in 2019 all samples met this criterion. Once delivered to the laboratory, samples enter a queue for processing and analysis, and may be analyzed marginally outside of recommended hold times (*e.g.*, by one day). The parameters most commonly analyzed by the laboratory outside the recommended hold times were orthophosphate, turbidity, nitrite+nitrate, and TDS. Analysis outside of the recommended hold time does not mean than the sample is compromised but may increase the uncertainty of the sample results.

The hold time for pH is short (15 minutes) making it impossible to submit the samples to the analytical laboratory within the recommended time frame. This limitation is mitigated by PRHP by monitoring pH in the field.

3.2.3.5 Data Import Screening

A data import screening system was developed for water quality monitoring data entered into the EQWIN database in Q1 2017. Lorax and PRHP asked BV to implement a system by which laboratory flags or notes are included as EDD comments with each water sample Certificate of Analysis (CoA) in Q2 2017. These comments include screening notes for the following flags:

- Dissolved metals measurably higher than totals;
- Nitrite higher than nitrate;
- Calculated charge balance greater than 10%;
- Hold time exceedances; and
- Raised detection limits.

These notes are imported into EQWIN as part of the data import screening process for further review.

Weekly ARD reporting has included summaries of the first four flags listed since mid-2017. This process has been a useful tool to provide high-level data QA/QC on a weekly basis and complements the more-detailed QA/QC analysis conducted on a quarterly basis. This approach has proven to be an effective way to address QA/QC concerns in reported water quality data in a timely and expedient manner.

In addition to QA/QC flags reported weekly, a screening step was implemented for *in situ* continuous measurements from probes installed in active RSEM ponds. As part of weekly ARD reporting, Lorax and PRHP review conductivity, turbidity and pH statistics collected over the weekly reporting period and qualitatively compare results to corresponding laboratory analytical data. Comparison of *in situ* data collected by data loggers to the laboratory analytical data for the same time period serves as a reasonable check for logger values. A logger value that is measurably higher or lower than the analytical value may indicate the logger requires servicing or may provide an indication of an issue related to data representativeness (*e.g.*, based on logger's deployment location in pond).

In addition to the *in situ* continuous measurement data collected by data loggers in active RSEM ponds, PRHP field staff also collect *in situ* field measurements using hand-held

meters at the time of analytical sample collection. A quantitative comparison of *in situ* field data from hand-held meters *versus* corresponding analytical measurements is presented in the next section.

3.2.3.6 Field Measurements

Field data for pH, turbidity, and conductivity are collected by PRHP field staff using hand-held meters at the time of analytical sample collection. These data are compared here to corresponding analytical measurements to provide an indication of the relative accuracy of field measurements.

Field data are used to inform real-time water management decisions, given that analytical results are typically reported one to two weeks after sample collection. Further, certain parameters in analytical samples have very short hold times, notably pH, which has a hold time of 15 minutes. This limitation is mitigated by PRHP by monitoring pH in the field. Currently, field pH measured at EOP is used to evaluate regulatory compliance with the discharge limit.

Median statistics are summarized to eliminate the effect of a minority of extremely high or low values which may bias an average calculation. A positive median difference shown in Table 3-34 suggests that field measurements tended to be biased higher than analytical results, while a negative median difference suggests field measurements tended to be biased lower.

In general pH, conductivity and turbidity field measurements in 2019 were higher than analytical measurements (Figure 3-34). Across RSEM stations, field and analytical pH measurements were comparable within a median difference of less than 4%. By comparison, conductivity measurements show a greater median difference of 8%.

The 2019 results suggest that variability and bias in field and analytical results for turbidity is influenced by the turbidity level (Figure 3-34). Overall turbidity measurements show a median difference of up to 68% between analytical and field measurements. However, values above 30 NTU show a negative bias and potentially higher variability of field relative to analytical results. While the data indicate that field turbidity measurements are generally suitable for informing TSS management decisions, the turbidity measurement uncertainty should be considered during data interpretation and when establishing and management decision triggers.

Table 3-34:
Comparison of 2019 Field and Analytical Measurements for pH, Conductivity and Turbidity

Station ID	Number of Samples					Annual Median Difference*	Annual Median Relative Percent Difference**

* Median difference between corresponding field measurements (results reported by PRHP staff from hand-held meters) and analytical measurements. Difference was calculated by subtracting the analytical value from the field value.

**Median absolute relative percent difference between corresponding field and analytical measurements. Relative difference was calculated by dividing the absolute difference between corresponding field and analytical measurements, by the average of the corresponding field and analytical measurements.

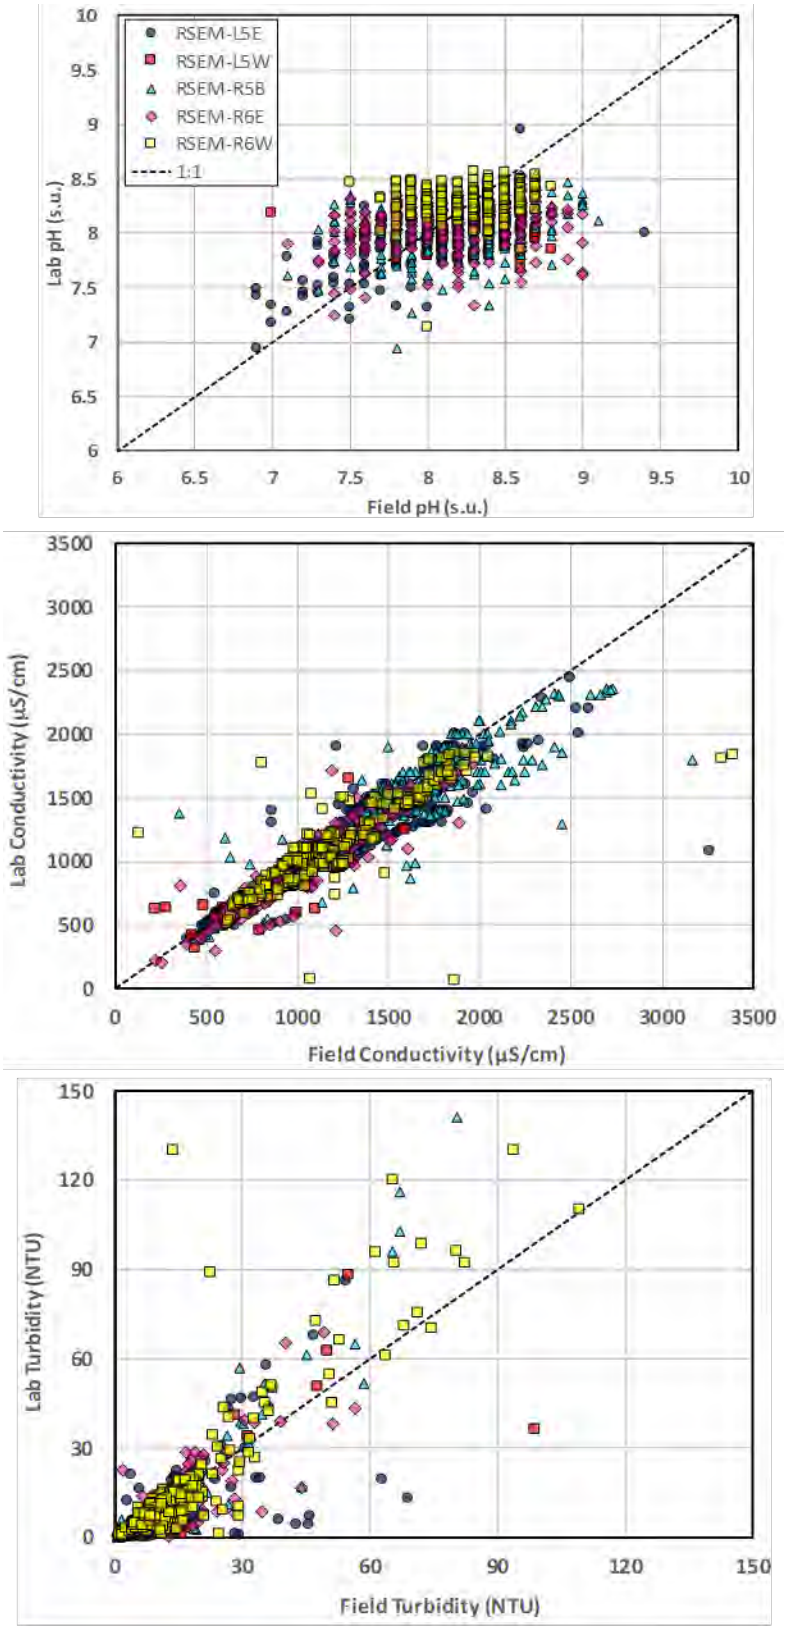

Figure 3-34: Field versus lab measurements for pH, electrical conductivity and turbidity for 2019

3.2.3.7 Continuous In Situ Measurements

Continuous *in situ* measurements for pH, conductivity and turbidity are monitored using a sonde probe which regularly logs a data point every 15 minutes. The *in situ* measurement that most closely corresponds to the time of analytical sample collection is compared to the corresponding analytical measurements to provide validation of continuous *in situ* readings.

Similar to field measurements, continuous *in situ* results are used to inform real-time water management decisions as part of the water management plan at Site C. Analogous to the comparison conducted between field and analytical results, median statistics for absolute difference and relative percent difference between *in situ* and analytical measurements are summarized in Table 3-35. The spatial difference between the location of the sonde probe relative to where analytical samples are collected can result in disagreement between continuous *in situ* measurements and analytical results. Across RSEM stations, a lower number of corresponding *in situ* and analytical results were obtained, relative to corresponding field and analytical results. This may be due to the fact that at times the probe can malfunction or be removed for maintenance.

In general, pH, conductivity and turbidity showed a positive bias towards higher continuous *in situ* measurements, compared to analytical measurements (Figure 3-35). The median difference between *in situ* and analytical results was low for pH (less than 4%) and slightly higher for conductivity (less than 13%), consistent with findings for the comparison of field to analytical results. While turbidity measurements show higher variability with a median difference of up to 144%, the positive bias towards *in situ* measurements is unaffected by the turbidity level. Overall, continuous *in situ* measurements for pH and conductivity show adequate agreement with the analytical results, comparable to the agreement between field and analytical measurements.

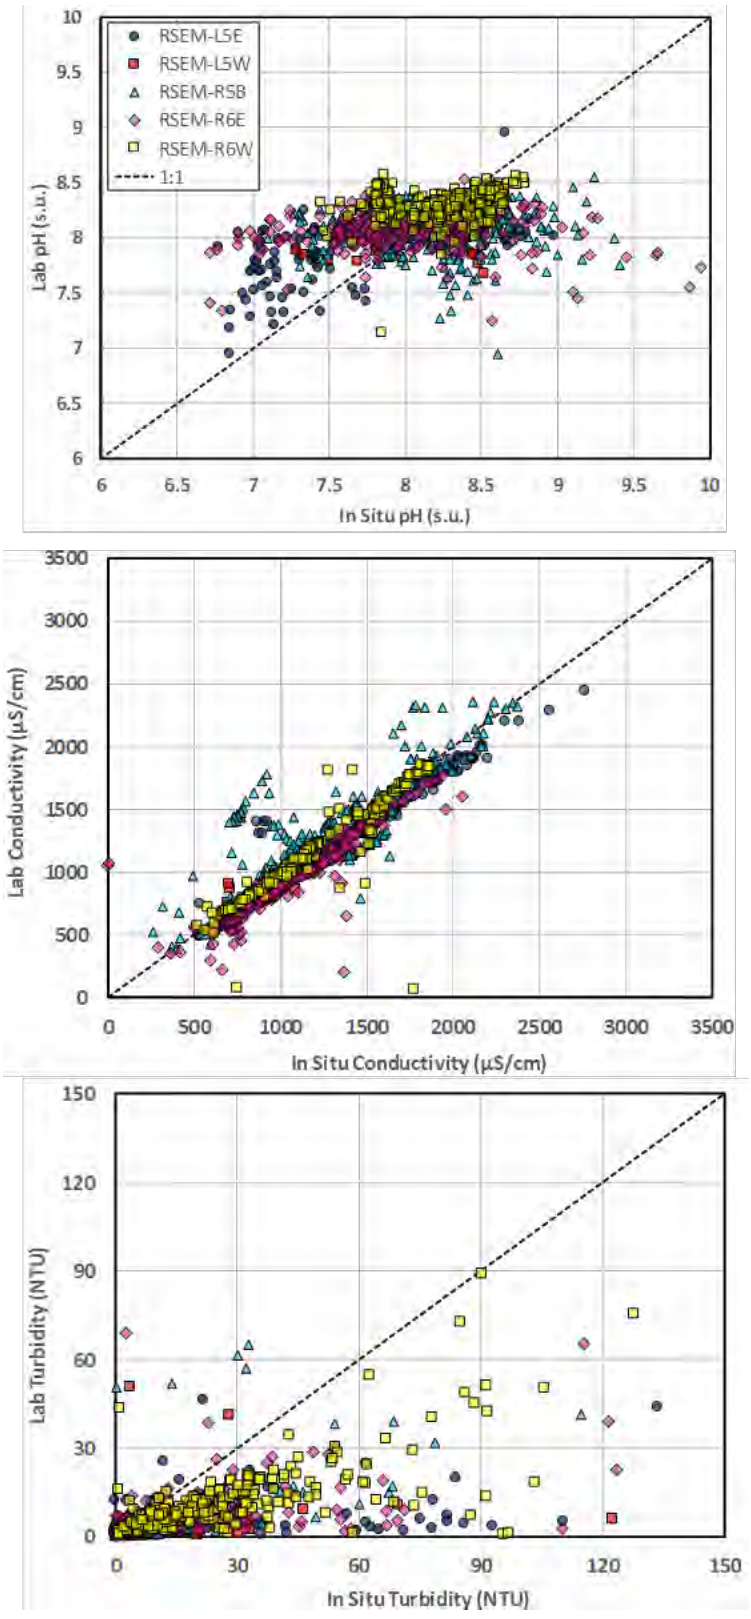

Figure 3-35: In situ versus lab measurements for pH, electrical conductivity and turbidity for 2019

3.2.3.8 Turbidity – TSS Relationship

Validation of the turbidity-TSS relationships developed by PRHP in 2018 for the RSEM sediment ponds (as described in Section 4.1) was conducted using 2019 data for the RSEM Area R5B, R6E and R6W (combined), L5E and L5W (combined), and L6 sediment control ponds. In Figure 3-36 through Figure 3-39, field (hand-held meter)turbidity results are plotted against the analytical TSS measurement for the corresponding water quality samples. Turbidity measurements were considered outliers and removed from analysis when values were approximately10x greater than the 90th percentile of each RSEM. Inclusion of these results can disproportionately shift the R^2 value and slope of the best fit line. A reference line calculated using the relationships developed by PRHP is plotted relative to a best fit linear relationship of the 2019 data. In addition, a new TSS-turbidity relationship for L6 has is presented. as PRHP had not previously developed a TSS-turbidity relationship for this pond because approval to discharge from the RSEM Area L6 pond was not received until 2019 Q4.

Across all sites, field measurements collected using hand-held meters showed good agreement with the existing PRHP TSS-turbidity relationships.

Notably, the majority of field turbidity measurements across RSEM stations are below 20 NTU, while linear relationships are primarily driven by a relatively small number of samples containing high turbidity levels. Moderate R^2 values ranging from 0.56 to 0.76 provide validation of a linear relationship between lab TSS and field turbidity at the RSEM Area R5B, R6 and L5 sediment control ponds. By comparison, this relationship is much weaker at L6 where turbidity levels are predominantly low (below 12 NTU). Overall the 2019 data provides supporting evidence of a comparable linear TSS-turbidity relationship to those developed by PRHP at RSEM Area R5B, R6 and L5 sediment control ponds. The relationships will continue to be evaluated and updated with more data in subsequent years to provide a more robust correlation.

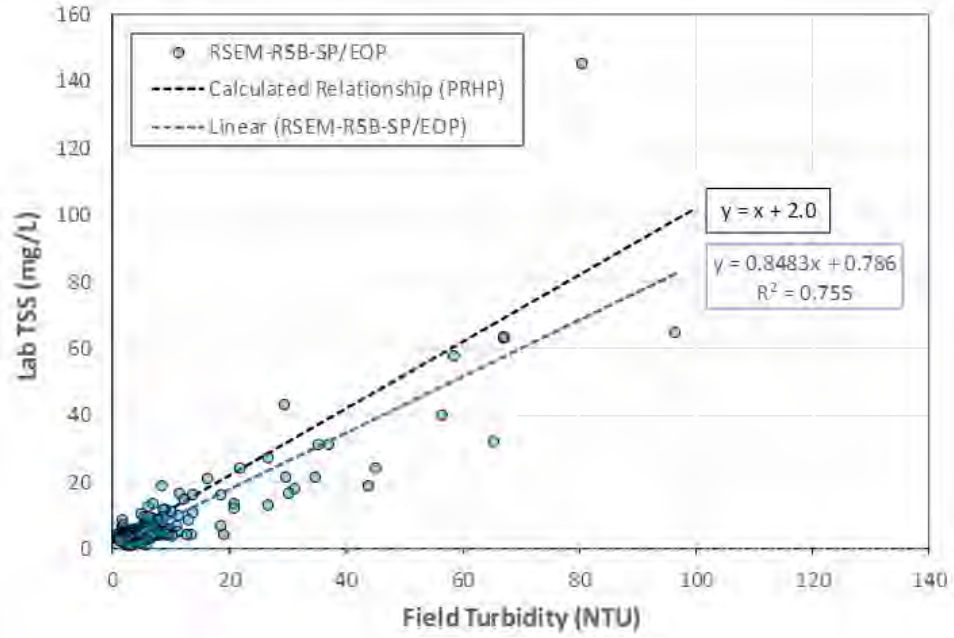

Figure 3-36: Lab TSS versus field turbidity at RSEM-R5B for 2019. Field turbidity results from March 17 (1,544 NTU) were not included to develop the TSS-turbidity relationship presented.

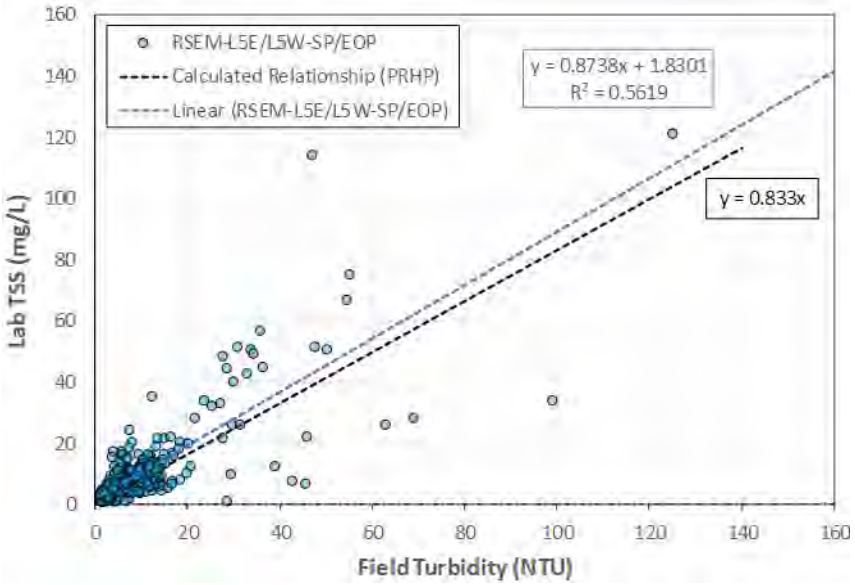

Figure 3-38: Lab TSS versus field turbidity at RSEM-L5E/L5W for 2019.

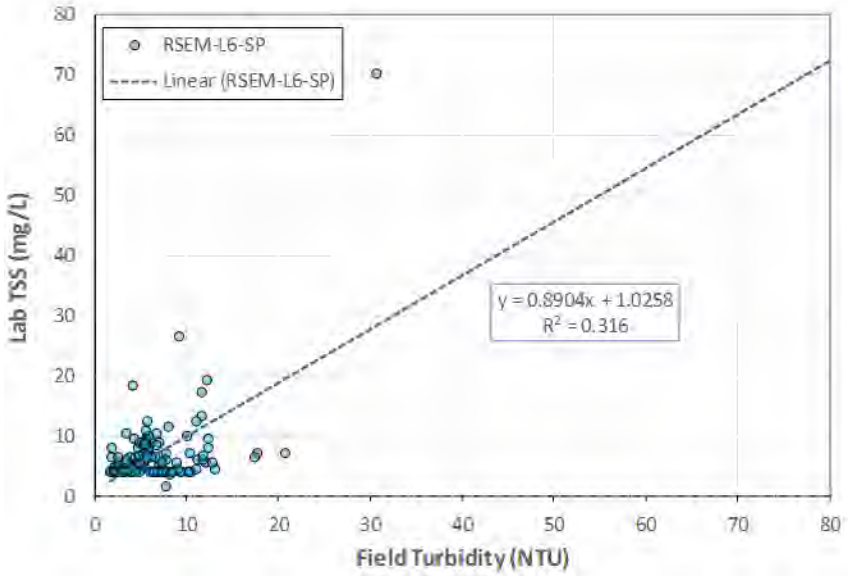

Figure 3-39: Lab TSS versus field turbidity at RSEM-L6 in 2019

3.2.3.9 Conclusions

Overall, the QA/QC results for the 2019 sampling program provide a reasonable level of confidence in the water quality data for field (hand-held and continuous) and analytical measurements. Minor issues associated with sample representativeness are noted but are not expected to measurably alter the interpretation of sampling data. Trends noted in the sections above will continue to be monitored and appropriate action will be taken to minimize potential sample contamination and data variability.

4. Key Findings

PEACE RIVER
HYDRO PARTNERS

4. Key Findings

The purpose of this section is to provide additional information that is required by the BC Hydro ARD/ML Management Plan or has been specifically requested by BC Hydro. It includes the updated relationship between turbidity and TSS, an assessment of the onset of ARD/ML, a summary of mitigation measures that were employed in 2019, a summary of exceedances of project-specific discharge limits that occurred in 2019, and an estimation of metal loads discharged to the Peace River.

4.1 Turbidity – TSS Relationship

The preliminary TSS-Turbidity relationship for all RSEM Area sediment ponds was derived prior to the start of construction and is presented in the Environmental Protection Plans (EPPs) that were developed for each construction area. The preliminary relationship was:

$$\text{TSS (mg/L)} = 0.83 \times \text{Turbidity (NTU)}$$

PRHP maintains current turbidity – TSS relationships for each RSEM sediment pond where field measurements are obtained. These relationships are reviewed periodically. The relationships in use in 2019 are summarized in Table 4-1 below.

Table 4-1:
Turbidity to TSS Conversion Relationships for In Situ Monitoring Equipment

Location	Conversion
RSEM-L5-SP	TSS = 0.833 × (Turbidity)
RSEM-R5B-SP	TSS = 1 × (Turbidity) + 2.0
RSEM-R6-SP	TSS = 0.85 × (Turbidity) + 1.4
Peace River*	TSS =0.73 × (Turbidity)

* Calculated at PAM stations (Peace River, above Moberly River); Ganshorn *et al.* (2019)

4.2 Onset of ARD/ML

Surface water quality and geochemical monitoring data are reviewed on a weekly and quarterly basis, respectively, to identify trends in the onset of ARD/ML. Monitoring results confirm previous evidence of localized acidic rock on both the Left Bank and Right Bank.

There is one large and several smaller catchment areas on the Left Bank. Contact water catchments on the Left Bank include the: RSEM Area L5 and LBEX catchment area; DTIP and DTOP working areas; Left Bank Cofferdam area; and RSEM Area L6. PAG

material was sampled in each of the Left Bank catchment areas, except for the DTIP and DTOP working areas as the PAG material excavated from the DTIP and DTOP is generally trucked directly to a RSEM Area approved for PAG disposal.

There are five catchment areas within the construction site on the Right Bank including Area A, South Bank Initial Access Road (SBIAR), RSEM Area R6 (which includes Area 20/21, RBDT and RCC), RSEM Area R5B (Approach Channel and Area 23) and RSEM Area R5A. PAG material samples were collected in the Area A, RSEM Area R6, RSEM Area R5A, and RSEM Area R5B catchments in 2019. No material samples were collected from the SBIAR catchment in 2019 as the SBIAR cut is currently managed by BC Hydro.

4.2.1 Left Bank

Key observations with respect to the onset of ARD/ML on the Left Bank in 2019 are as follows:

- AG material was identified in RSEM Area L5, the RSEM Area L5 Extension, RSEM Area L6, the LBEX, and the natural bluff below the LBEX. No samples in the Left Bank Cofferdam/Dam Core area were AG at the time of sampling.
- The RSEM L5E, L5W, and L6 sediment ponds remained circumneutral to basic throughout 2019. The metal concentrations generally remained low and below the discharge limits in these sediment ponds. However, T-Cd concentrations exceeded the discharge limits from August 19-23 and from November 20-23 in discharge from the RSEM L5 East sediment pond (see Section 4.5). These exceedances were related to rainfall and snow melt events which washed exposures of weathered shale in the southeast end of RSEM Area L5 and mobilized soluble ARD/ML products.
- Occasional acidic field pH measurements (pH < 6.0) were recorded at surface water monitoring stations in 2019, including:
    - Two measurements at DTIP-DW; and
    - Single measurements at ADIT-4, LBCD-SUMP, and LBDA.

    Results at these stations are influenced by ARD/ML runoff from the naturally weathered bluff located adjacent to the sample locations.
- In addition, a single measurement at LBL3C-2.19 had a pH < 6.0. However, this measurement is not consistent with the rest of the monitoring data at this site and is not considered indicative of ARD/ML onset in RSEM Area L3, which was not permitted for storage of PAG material.

4.2.2 Right Bank

Water quality and ARD monitoring on the Right Bank led to the following key observations:

- AG material was identified in the Approach Channel, parts of RSEM Area R5A and small bedrock exposures in Area A. The samples from the RCC Excavation indicate that the rinse pH of material in this area is decreasing but remains marginally above a rinse pH of 5.5. No AG samples were collected from the Right Bank Dam Core.
- The RSEM R6 East and West sediment ponds remained circumneutral to slightly basic. There were occassional exceedances of the discharge limits in 2019 (see Section 4.5). Discharge from the RSEM R6 East sediment pond exceeded the discharge limit for T-Zn on June 29 and T-Cd on November 26. Discharge from the RSEM R6 West sediment pond exceeded the discharge limits on the following days: January 30 (T-Cu, T-Zn) and June 29 (T-Zn). These exceedances were generally attributed to PAG-influenced runoff from snowmelt (January and November) or rainfall events (June).
- The R5B sediment control pond was circumneutral to basic. The following metal concentrations exceeded the discharge limits in 2019: T-Cd (March 14-21; August 22-24), T-Cu (March 14-21), and T-Zn (March 14-21; August 22-23) (see Section 4.5). These exceedances are from PAG influenced runoff associated with snowmelt in March and rainfall in August. The precipitation washes soluble ARD/ML products, including Cd, Cu, and Zn, from PAG exposures in the Approach Channel.
- Acidic field pH measurements were recorded at AC-EAST-CONVEYOR during brief periods in late March and late June/early July 2019 (eight days in total). The low pH values measured at this monitoring station are related to acidic runoff from the exposed AG rock in the Approach Channel. The pH returned to circumneutral following these events. Other surface water stations near the Approach Channel occasionally had acidic field pH readings. One acidic field pH value was record at RBAC-SUMP (January 2019) and RB-R5B-ACDC (March 2019).
- The RSEM R5A Ponds remained circumneutral, although several metals were above the applicable guidelines in the discharged water (see Section 4.5). These elevated values were likely due to snow and ice melt causing turbid runoff in RSEM Area R5A.

4.3 Mitigation

Given the onset of ARD/ML in exposed PAG material on both the Left Bank and Right Bank, mitigation has been implemented to minimize effects on surface water and groundwater quality. Potential environmental effects from ARD/ML are mitigated primarily through covering of weathered PAG material with unweathered PAG or NPAG material, water management and water treatment. These key mitigation measures that were employed in 2019 are summarized below.

4.3.1 Material Management

Weathered PAG material was excavated or covered to minimize potential ARD/ML on both the Left and Right Banks. The timely excavation or cover of weathered material is a key mitigation strategy in the RSEM Area L5 and RSEM Area R5A disposal areas. The potential for ARD/ML due to bedrock exposed as a result of excavations in the vicinity of the Diversion Inlet and Outlet Portals and in the Central Cofferdam was mitigated with the application of shotcrete to the exposed PAG bedrock slopes.

The southeastern edge of the RSEM Area L5 stockpile has remained uncovered for an extended period of time and is becoming acidic. Collection of water in the ditch below this edge of the stockpile was implemented as a temporary mitigation measure and the ditch is periodically dewatered to the MWTF for treatment prior to discharge.

The Approach Channel excavation was initiated in Autumn 2016 and mostly completed by the end of Q2 2017. The excavated faces have remained exposed since that time and are at advanced stages of weathering. Since the original excavation, several minor excavations have scraped material off of the exposed faces; however, the majority of samples have had a rinse pH below 7 with several samples being classified as currently AG (rinse pH < 5.5). Until further excavation occurs in the Approach Channel to expose unweathered bedrock, the acidic runoff from this area is collected and treated, as needed. Excavation of the Approach Channel is expected to resume in early 2020.

The requirements of Section 7.2.4 (BC Hydro, 2016a) related to PAG contact RSEM sediment were triggered at RSEM R5B, as this pond was dredged in early September. The dredgeate was transferred to RSEM R5A for long term storage.

4.3.2 Water Management

PAG-contact surface water runoff was stored on both banks through 2019 in Approach Channel sumps and Cofferdam sumps on the Left Bank. Water requiring treatment was conveyed (by water truck or pumped from the Approach Channel) to the MWTF. The MWTF was operated consistently through 2019.

On the Left Bank PAG-contact surface water runoff was managed to prevent direct discharge to the Peace River. PAG-contact water from DTIP and DTOP was held in

several temporary ponds and was trucked to the MWTF for treatment. Water from the LBEX Pond (until decommissioned) and Central Cofferdam was directed to the MWTF for treatment or RSEM L5 East sediment control pond for discharge. Similarly, water from the LBEX sumps was transferred to RSEM L5 sediment ponds.

On the Right Bank, surface water runoff is conveyed to the RSEM Area R6, R5B or R5A sediment ponds. In general, surface water runoff in RSEM Area R6 was managed so that it remained within project-specific discharge limits and was discharged via the RSEM Area R6 sediment ponds. In the RSEM Area R5B catchment, surface water runoff was directed to the R5B pond and PAG influenced runoff from the East Conveyor Seep, RBAC Sump, RBAC Seep and the upper Approach Channel ditch was directed to the MWTF Pre-Treatment Pond. Small amounts of water that collected in the RSEM R5A ponds were transferred to the RSEM R5B pond in 2019.

4.3.3 Mobile Water Treatment Facility

PRHP commissioned the MWTF in 2018 Q3. The MWTF is located on a pad south of RSEM Area R5B. PAG-contact water is pumped to the Pre-Treatment Pond which is located adjacent to the MWTF. The capacity of the Pre-Treatment Pond was increased in 2019 to store greater quantities of PAG contact water when inflow exceeds the MWTF treatment rate during high runoff events. Treated effluent from the MWTF is discharged to a sludge pond, which is divided into three sequential cells by lined berms. Discharge from the final cell is directed to the RSEM R5B sediment pond through the AC DC ditch. This configuration is shown in Figure 4-1 below.

Surface water runoff from the Approach Channel and water from other locations (RSEM Areas R5A and R6 sediment control ponds, LBEX-SP, DIC/DTIP sumps, DOC/DTOP sumps, LCBD sumps, East Conveyor seep, RCC, RBAC sump and RBAC Seep) was directed to the Pre-Treatment Pond during 2019. The MWTF process was effective at buffering pH and reducing metal concentrations to within the project-specific discharge limits in treated water.

The treatment process adds a lime slurry to the influent to increase pH into the target range of 9.6 - 9.8, which precipitates metals as insoluble metal hydroxides. A flocculant is added to facilitate the coagulation and settling of the freshly precipitated solids. The process produces a gelatinous sludge with slow settling characteristics. The effluent pH is reduced to acceptable levels prior to discharge by sparging CO_2 into the settling pond final cell.

The treatment process effluent contains suspended particulates that are settled in the MWTF sludge collection cells. Accumulated sludge from the collection cells was removed and disposed off-site at a licensed disposal facility:

- Feb. 25 – Mar. 4
- Jun. 12 – Jun 15

ARD/ML 2019 Annual Report

TITLE:

MWTF Flow Configuration

PROJECT #: A416-1 *FIGURE:* 4-1

Coordinate System: *NAD 1983 UTM Zone 10N* ***Datum:*** *North American 1983* ***Units:*** *Meter*

Path: *P:\@Drafting\SiteC\Drafting Figures\MXD\2018AnnualReport\Fig 4_3_1_MWTF InflowsOutflow_20190313.mxd*

Sludge was removed by vacuum truck and transported to RSEM R5A for dewatering in geotextile bags in 2019 Q3 and Q4. Transfers occurred on:

- Aug. 23-24 (6 bags);
- Sept. 14-15 (4 bags);
- Oct. 17-18 (6 bags); and
- Nov. 28 -29 (4 bags).

The MWTF operated through 2019, except in the instances noted above treatment was temporarily suspended to allow for sludge collection. In addition, active water treatment was temporarily suspended in the later portion of Q4 when sub-zero temperatures at site limited the amount of water that required treatment. During these periods untreated MWTF discharge is recirculated to the Pre-Treatment pond, as needed, to accumulate water in the pond and maintain operability of the MWTF through winter conditions.

Additional water treatment capacity may be warranted should material management and water management measures be unable to sustain acceptable water quality in discharges from RSEM sediment ponds. Material management and water management are the primary and secondary mitigation strategies as noted above, and additional water treatment will also be considered as a contingency measure, if necessary.

4.4 ML/ARD Risk Levels

4.4.1 Comparison of Predicted and Measured RSEM Discharge

A water quality model for the Project was developed as part of the Environmental Assessment (EA), to predict whether discharge from RSEM areas would exceed allowable concentrations (KCB, 2014). Predicted concentrations were initially compared against Metal Mine Effluent Regulations (MMER) Schedule 4 criteria limits, and predictions were only provided for metals with MMER limits. Subsequently, more stringent limits were specified in Appendix E (Revision 5.2, dated July 26, 2016) of the CEMP (BC Hydro, 2016a). The predicted concentrations discussed in the following section are limited to T - Cu and T-Zn to demonstrate key observations.

The water quality model indicated that Upper Case loading rates (95^{th} percentile rates for Humidity Cells and Field Bins), which were believed to represent larger rainstorm "flush" events, could result in concentrations exceeding MMER Schedule 4 limits in discharges from RSEM Area R5B and R5A, unless mitigated (KCB, 2014). The maximum monthly average predictions for T-Cu and T-Zn are shown in Table 4-2. These predicted exceedances are caused primarily by the area of PAG shale exposed as a result

of the excavation of the Approach Channel in the RSEM R5B catchment (assumed to reach a maximum of 17.7 ha), and by the exposed PAG shale expected to be deposited (9.3M m^3) in RSEM Area R5A late in the construction phase of the Project (KCB, 2014).

Table 4-2:
Comparison of Maximum Monthly Water Quality Predictions for T-Cu and T-Zn (from KCB, 2014), CEMP requirements, and MMER Schedule 4 limits for discharge from RSEM Areas R5B and R5A

Parameter	CEMP discharge limit (mg/L)	MMER 30 day limit (mg/L)	R5B maximum prediction (mg/L)	R5A maximum prediction (mg/L)
T-Cu	0.011	0.3	0.14	2.4
T-Zn	0.033	0.5	0.72	13

The mitigation proposed was placement of overburden or recently excavated shale to cover acidic material. It was determined that at 70% cover, some water quality objectives were still not achieved, but they were met with 100% cover, and it was estimated that 80% to 90% cover would be required to meet the MMER criteria (KCB, 2014) in discharge from the RSEM R5B and R5A ponds.

In a subsequent report (KCB, 2016), it was noted that covering the Approach Channel excavations on the Right Bank may be impractical, and for this reason only the unmitigated scenario for R5B (0% of PAG material covered) was modelled. In RSEM Area R5A, covering deposited material is practical, and mitigated scenarios for R5A (70% and 100% of PAG material covered) were modelled. These results exceed the discharge limits set out in the CEMP, without additional mitigation (water treatment), as shown in Table 4-3 below.

Table 4-3:
Comparison of Maximum Monthly Water Quality Predictions for T-Cu and T-Zn (from KCB, 2016), CEMP requirements, and MMER Schedule 4 limits for discharge from RSEM Areas R5B and R5A

Parameter	CEMP discharge limit (mg/L)	MMER 30 day limit (mg/L)	R5B maximum prediction (mg/L)	R5A maximum prediction (mg/L)
T-Cu	0.011	0.3	0.15	2.5
T-Zn	0.033	0.5	0.7	13.3

The predictions cited above are for the maximum monthly average concentrations for the period included in the water quality model, from October 2014 through 2024. The predictions are based on the assumptions (KCB, 2014) that:

- A maximum extent of 17.7 ha of PAG shale would be exposed in the Approach Channel in the RSEM Area R5B catchment; and

- Approximately 10.6 Mm^3 of material, including 9.3M m^3 of (PAG) rock and 1.25M m^3 of overburden, would be placed in RSEM Area R5A.

At the end of 2019, the area of exposed PAG shale in the Approach Channel was approximately 8.9 ha, or about 50% of the area that will ultimately be exposed. The total volume of PAG rock deposited in RSEM Area R5A is approximately 5.1M m^3, or approximately 55% of the total volume that was expected to be deposited by this time (to the end of 2019 Q3), which includes almost all of the material that was expected to be deposited to the completion of the project, as shown in Table 4-4 below. This is primarily due to the temporary deferral of the remaining Approach Channel excavation.

Table 4-4:
Comparison of scheduled and reported volumes of material placed in RSEM Areas R5A (scheduled volumes, KCB, 2014, Page 80, Table 39)

Construction Stage	Time	Scheduled Rock (PAG) Material added[1] (m^3)	Reported PAG material added[2,3] (m^3)	Scheduled Cumulative volume of Rock (PAG) stockpiled (m^3)	Reported Cumulative volume of PAG stockpiled (m^3)	%
Diversion Stage 1	4Q15 – 3Q16	2,827,600	0	2,827,600	0	0%
	4Q16 to 3Q17	4,151,200	3,541,397	6,978,800	3,541,397	38%
	4Q17 to 3Q18	487,300	454, 045	7,466,100	3,995,442	43%
	4Q18 to 3Q19	1,818,800	1,122,639	9,284,900	5,118,081	55%
Diversion Stage 2	4Q19 to 3Q20	-	-	-	-	
	4Q20 to 3Q21	-	-	-	-	
	4Q21 to 3Q22	21,000	-	9,305,900	-	

[1]Values from KCB, 2014; Table 39.
[2] Values from Lorax Quarterly ML/ARD Reports.
[3]It is assumed that all rock volumes are PAG.

The predicted (KCB, 2016) and measured concentrations for total Cu and Zn for RSEM Area R5B (no mitigation) are shown in Figure 4-2 and Figure 4-3. Predicted total Cu and Zn concentrations (KCB, 2016) for RSEM Area R5A (0% and 100% cover) and the measured concentrations for RSEM R5A Pond C are shown in Figure 4-4 and Figure 4-5. The MMER and CEMP discharge limits are shown for comparison.

The water quality model results for RSEM Area R5B indicate that Cu and Zn concentrations would almost always exceed the CEMP discharge limits without mitigation, assuming upper case geochemical source terms, which were stated to be representative of large precipitation events. Water treatment was initiated in July 2018 and the water management system was modified in October 2018 to capture PAG impacted surface water during large storm events and direct it to the MWTF.

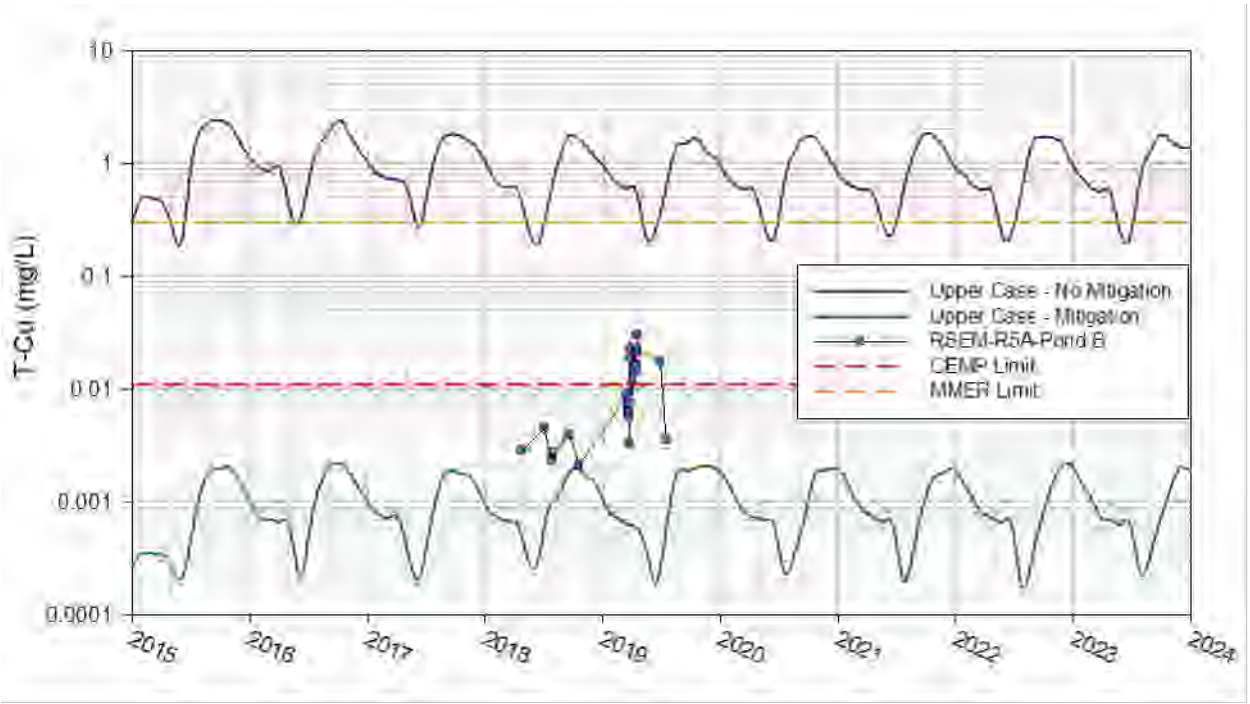

Figure 4-4: T-Cu at RSEM R5A, Measured and Predicted with No Mitigation and 100% Mitigation

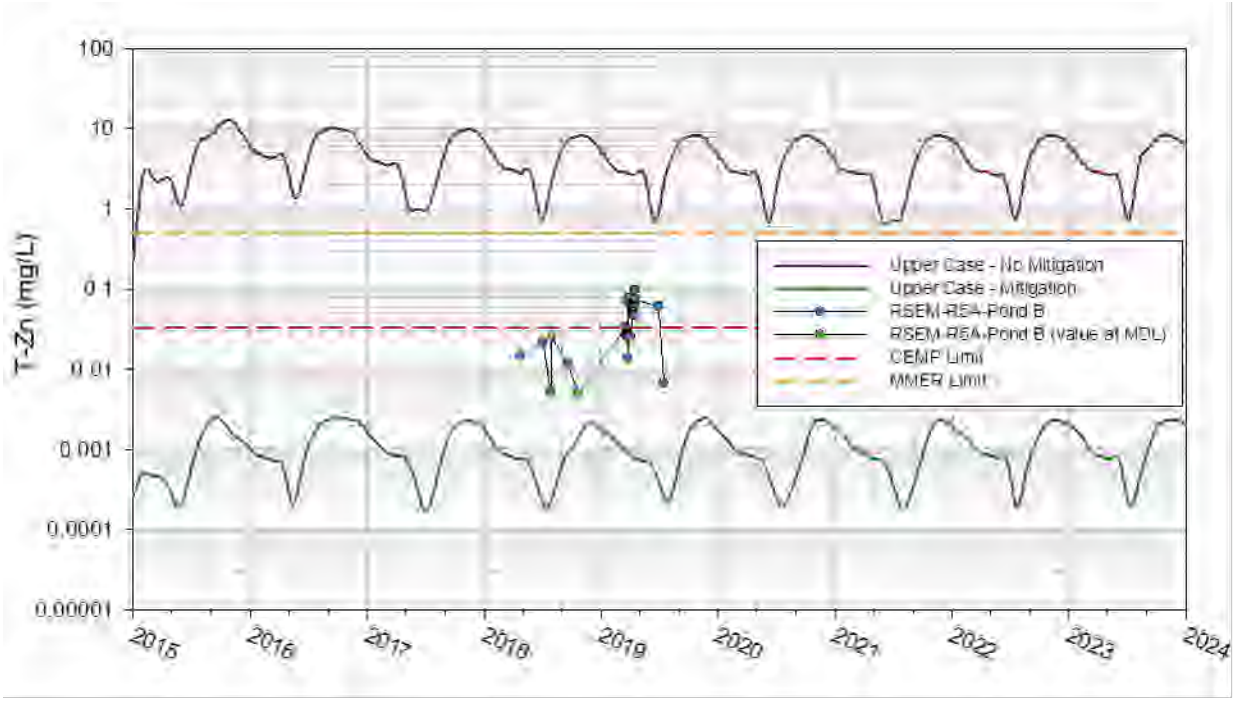

Figure 4-5: Zn at RSEM R5A – Measured and Predicted with No Mitigation and 100% Mitigation

The water quality monitoring results for RSEM Area R5A indicate that Cu and Zn concentrations are generally slightly elevated relative to the concentrations predicted with implementation of mitigation (100% cover), which is consistent with actual conditions in the field (the % cover in the latter half of 2019 was estimated to be approximately 75%). These plots also indicate that Cu and Zn concentrations approach or exceed RSEM sediment pond discharge limits and underscore the importance of continued mitigation in RSEM Area R5A.

These results confirm that the inherent risk in the RSEM Area R5B and R5A catchments without mitigation is high, and that avoiding exceedances in both catchments will require diligent and consistent implementation of mitigation measures. In the RSEM Area R5B catchment, it is necessary to collect and treat water that contacts weathered shale in the Approach Channel excavation. The surface area of this excavation is expected to increase substantially in 2020. In the RSEM Area R5A catchment, covering PAG shale with freshly excavated material is necessary, and the volume of PAG material that will be deposited is also expected to increase substantially as excavation of the Approach Channel resumes.

A consideration for RSEM Area R5A in 2020 through to the establishment of the permanent reservoir behind the dam is the ability to cover exposed PAG surface to limit the extent of AG surfaces. It is currently Lorax's understanding that the difference between the cumulative volume of scheduled (9.3M m^3) and reported (5.3M m^3) PAG rock at the end of 2019 (4M m^3), will be deposited in RSEM Area R5A in 2020. Subsequent to this there will be relatively small volumes of additional material placed in the RSEM area to cover the PAG exposure and limit weathering of the PAG surface and reduce the amount of PAG runoff. The outer surfaces of the PAG bedrock in the RSEM will be progressively covered with granular fill to limit the release of ARD.

4.4.2 Risk Rating Matrix

A risk rating matrix was included in the Exceedance Response Plan (PRHP, 2017c) that was finalized in June 2017. It is intended to facilitate the advanced planning and strategic implementation of water treatment, recognizing that procurement, construction and commissioning of a water treatment facility requires some lead time.

A water quality risk rating of low, moderate or high is assigned to each of the water collection systems on site. Consideration has been given to active PAG-containing RSEM sediment ponds including the RSEM Area L5, R5B, and R5A sediment ponds.

The rating system employed for the RSEM ponds reflects:

- The current geochemical risk in the catchment area upgradient of the sediment pond, as determined primarily from the proportion of exposed material with low (< 5.5) rinse pH values;
- The quality of the water that has accumulated in the pond, as determined primarily by the sulphate concentration, field pH and field conductivity; and
- Other information determined to be relevant.

The current risk ratings are summarized in Table 4-5 below. The general intent of the risk ratings is to trigger action when the onset of ARD/ML is evident (moderate rating) and when water treatment may soon be required to maintain compliance with EOP discharge limits (high rating).

A total of just over 1.3M m^3 of PAG material was placed in RSEM Area L5 and the L5 extension by the end of 2019, with a total of just over 1.4M m^3 stored on the Left Bank in total. The Reference Concept Report assumed that a total of 780,000 m^3 of (PAG) rock would be stored in RSEM Area L5 and progressively co-placed and encapsulated with overburden clays (KCB, 2014). The current volume is approximately 160% of the expected volume. In 2019, this material originated primarily from the Central Cofferdam and DTIP areas. Some PAG material stockpiled in the southeastern part of RSEM Area L5 was relocated and further PAG relocation is expected later in the year. The L5 Extension Area was commissioned for use starting in 2019 Q2.

The RSEM Area L5 is rated as moderate risk due to the larger than anticipated volume of PAG rock now stored in it, and the proportion of this material with rinse pH less than 5.5 in specific areas within RSEM Area L5, currently including an area at the southeast end of the facility. In addition, sulphate and conductivity in the L5E pond are elevated, and concentrations of Mn and dissolved Cd increased in 2019 Q4 indicating a greater PAG influence during Q4.

The RSEM Area L6 sediment pond has a small catchment area. It is excluded from the Risk Rating Matrix as the water in this pond would be transferred to the existing MWTF if treatment was required, rather than installing a water treatment facility specifically for this pond.

The LBEX Sediment Pond was decommissioned and the pond area was excavated in 2019 Q3. Consequently, the LBEX pond has been removed from the Risk Rating Matrix.

Table 4-5:
Risk Rating Matrix for PAG-Containing RSEM Sediment Ponds in Q3 2019

Factor	Sediment Pond(s)			
	L5	**R6**	**R5B[1]**	**R5A[2]**
% of exposed material with rinse pH < 5.5	~ 25%	< 10%		~ 25%
pH (in sediment pond)	lab pH > 6.8 in all samples	lab pH > 7 in all samples		lab pH ≥ 7.5 in all samples
Sulphate (in sediment pond)	sulphate median > 400 mg/L in E pond	sulphate < 310 mg/L in E and W pond EOP samples		Maximum sulphate > 650 mg/L in pond B samples[3]
Conductivity (in sediment pond)	lab conductivity median > 1300 µS/cm in E Pond	lab conductivity < 1500 µS/cm in E and W Pond		Maximum lab conductivity > 2,000 µS/cm in pond B samples[3]
Risk Rating				
Rinse pH of exposed material in catchment	Moderate	Low		Moderate
pH (in sediment pond)	Moderate	Low		Low
Sulphate (in sediment pond)	Moderate	Moderate		Moderate
Conductivity (in sediment pond)	Moderate	Low		Moderate
Overall Risk Rating	**Moderate**	**Low**	**High**	**Moderate**

Notes:
1. Ratings are no longer provided for RSEM R5B since water treatment has been implemented in this catchment.
2. Water quality sampling at RSEM R5A is less frequent than the R5B and R6 sediment ponds, as the pond is managed to prevent discharge to the Peace River from this pond.
3. Maximum concentrations in ponds A and C were higher, but influenced by high concentrations of TSS, and therefore not clearly indicative of ML/ARD influence.

On the Right Bank, there is an estimated area of 8.9 ha of exposed PAG shale in the RSEM Area R5B catchment. The requirement for water treatment was triggered in 2018, and the MWTF commissioned for this purpose. For this reason, a high risk rating has been assigned. PAG influenced runoff from the Approach Channel is diverted to the MWTF for treatment prior to discharge to RSEM R5B pond, thereby mitigating the risk of RSEM discharge limit exceedances from these waters. The treatment process was effective throughout 2019. All Approach Channel runoff was stored for treatment prior to discharge.

In 2019, PAG deposition reached an estimated 5,298,254 m^3 in RSEM Area R5A. The material originated primarily from the Dam and Core Buttress, Core Trench and the Spillway (included in the Approach Channel total). The risk is mitigated by covering PAG material before the onset of ML/ARD. The RSEM R5A ponds are currently rated as moderate risk, indicating that the onset of ARD/ML is evident in the upgradient catchment. Sulphate and conductivity were trending higher in Pond B in 2019 Q4. Dissolved concentrations of Cd, Cu and Zn were somewhat elevated but below EOP discharge limits.

There is little PAG material in the RSEM Area R6 catchment and the ML/ARD risk is low. Some exposed PAG material is located along the South Bank Initial Access Road (SBIAR). However, this relatively minor risk is managed by BC Hydro. Bedrock exposure in the RCC excavation is reduced by cover with roller compacted concrete. ARD that may be produced in the area is neutralized by the alkaline water released by concrete structures being built in this area.

Additional management measures to mitigate risk include: 1) minimizing exposures of acid generating surfaces by placement of fresh PAG and non-PAG material to cover weathered PAG materials, which will limit contact of surface runoff with acid generating materials; and, 2) active management of water levels in the RSEM R5A ponds to prevent discharges. Active management options could include adding additional temporary water storage, pumping water between the different RSEM R5A ponds or transporting water by truck to the MWTF or other sediment ponds on site.

4.5 Water Quality Exceedances

Any exceedance of EOP discharge limits in laboratory analysis of water discharged from PAG-containing RSEM sediment ponds to the Peace River is reported within 24 hours of receiving the analytical water quality results. Exceedances are also noted in weekly reports.

Exceedances in surface water runoff discharged from the construction site in 2019 occurred as a result of snow melt and periodic larger precipitation events. This resulted in exceedances on both the Left and Right Banks as summarized below.

4.5.1 Snow Melt in Late January and Mid-March

There was a minor exceedance in the discharge from the RSEM R6W pond on January 30th, 2019, following a short-lived thaw in late January, and exceedances in discharge from the RSEM R5B and R5A ponds (A, B and C) when the snowpack rapidly melted during warm weather from March 10th through March 21st. These are summarized in Table 4-6 below. Further details are provided for each exceedance below.

Table 4-6:
Summary of Exceedances in Water Discharged from PAG-Containing RSEM Sediment Ponds in January and March, 2019

Date(s)	Station	Parameter(s)	Date Results Received*	Cause
30 January	RSEM-R6-WP	T-Cu T-Zn	7 February	Snow melt accumulated over ice and discharged for approximately 2.5 hours
14–21 March	RSEM-R5B-EOP	TSS T-Cd T-Cu T-Zn	21 March – 1 April	Snowmelt rinsing Approach Channel
18–21 March	RSEM-R5A-A	T-Ag T-As T-Cu T-Fe T-Zn TSS	27–29 March	Snow and Ice Melt causing turbid runoff in RSEM Area A
19–21 March	RSEM-R5A-B	TSS T-Ag T-As T-Cu T-Fe T-Zn	27 March	Snow and Ice Melt causing turbid runoff in RSEM Area A
19–21 March	RSEM-R5A-C	TSS T-As T-Co T-Cu T-Fe T-Pb T-Se T-Zn	27 March	Snow and Ice Melt causing turbid runoff in RSEM Area A

*Represents the date results were reported by the analytical laboratory to PRHP and Lorax. Results were reported by Lorax to PRHP in an Exceedance Report within 24 hours of receipt of analytical results.

Site temperatures were above freezing January 25–27, 2019, reaching 8ºC on January 26. During this time melt water accumulated on top of the ice covering RSEM R6 West sediment pond. The accumulated water discharged from the pond for a short period. The exceedance is summarized in more detail in Table 4-7 below.

Table 4-7:
Summary of Exceedance for RSEM-R6-WP on January 30th, 2019

Sample No. (Pond ID)	Date Sampled	Date Results Received	Parameter	Measured Concentration (mg/L)	Discharge Limit (mg/L)	Estimated Volume Discharged (m^3)
VE2161	30 January	7 February	T-Cu	0.0117	0.011	4.2
			T-Zn	0.186	0.033	

Site reports indicate site temperatures increased to above freezing beginning March 10 and thawing conditions continued through March 21. TSS exceedances were driven by turbid meltwater generated during this thaw and directed to the RSEM R5B pond and R5A ponds A, B and C. Coincident T-Cd, T-Cu, and T-Zn exceedances are attributed to elevated TSS. These exceedances are summarized in more detail in Table 4-8, Table 4-9, Table 4-10 and Table 4-11 below.

Table 4-8:
Summary of Exceedances for RSEM-R5B-EOP on March 14–21, 2019

4.5.2 Rain in Late June

There was a slight exceedance of the discharge limit for T-Zn from the RSEM R6W and R6E ponds on June 29, 2019. These exceedances were attributed to rain contacting shale exposures in SBIAR ditch and the Right Bank Cofferdam RCC area. Recorded precipitation at the North Camp weather station was 69.1 mm from June 23 – 29. These exceedances are summarized in Table 4-12 and Table 4-13 below.

Table 4-12:
Summary of Exceedance for RSEM R6W on June 29, 2019

Sample No.	Date Sampled	Date Results Received*	Parameter	Measured Concentration (mg/L)	Discharge Limit (mg/L)	Volume Discharged on Day of Exceedance (m^3)
VZ9025	29 June	9 July	T-Zn	0.0406	0.033	1050

*Represents the date results were reported by the analytical laboratory to PRHP and Lorax. Results were reported by Lorax to PRHP in an Exceedance Report within 24 hours of receipt of analytical results.

4.5.3 Rain in Late August

There were minor exceedances in the discharge from the RSEM L5E pond on the Left Bank and from the RSEM R6W and R5B ponds on the Right Bank between August 16th and 23rd. These are summarized in Table 4-14, Table 4-15 and Table 4-16 below. A total of 21.4 mm of rain fell on August 15th, and an additional 38.4 mm fell through August 23rd.

The RSEM-R6W sediment pond exceedances were TSS-related due to heavy rain from August 15-19, as noted above. A turbidity curtain was installed on August 16 to reduce turbidity in the pond. Flocculant was added to the pond from August 18th to the 20th.

Table 4-14:

4.5.4 Snow Melt in Late November

Rapid snow melt resulted in minor exceedances in discharge from the RSEM L5E pond from November 20-23, and from the RSEM R6E pond on November 26, 2019, as summarized in Table 4-17 and Table 4-18 below. These were due to a rapid thaw in mid-November when the high temperature reached a maximum of 11.2°C on November 17th. The snowpack rapidly diminished from a peak of 34 cm (as measured at the FSJA station) on November 13th to 0 cm by the 20th.

Table 4-17:
Summary of Exceedance(s) for RSEM L5E on November 20-23, 2019

Sample No.	Date Sampled	Date Reported	Parameter	Measured Concentration (mg/L)	RSEM Discharge Limit (mg/L)	Volume Discharged on Day of Exceedance (m^3/day) [A]

4.6 Metal Loads

Calculation of metal loading to the Peace River on a weekly basis is a requirement of section 7.3.2 of Appendix E of the CEMP. In order from upstream to downstream, quarterly loading to the Peace River from the RSEM R5A (there were loads discharged in March only), RSEM L5 (combined loading from L5E and L5W, no loads were discharged in January or February), RSEM R5B, and RSEM R6 (combined loading from R6W and R6E) sediment ponds in 2019 are presented in Table 4-19, Table 4-20, Table 4-21 and, Table 4-22, respectively.

Table 4-19:

Daily loads for each RSEM sediment pond were calculated by applying the concentration measured in the daily EOP grab sample to the total volume of water discharged on that day, as recorded by the pond's flow meter. Daily loading estimates were then summed for each month to obtain the monthly load discharged to the Peace River, providing an estimate of the total load discharged from the Project site.

To provide context for RSEM pond loading, average monthly metal loads for Cd, Cu, and Zn in the Peace River were calculated using available information on Peace River flows and water quality at station PR-3.88 (formerly PR-3) to provide benchmarks to which

metal loading from Site C (above) can be compared. The dissolved, rather than total, metal fraction measured at PR-3.88 was used in the calculation to minimize the potential influence of high turbidity water on the metal loading values. These loads are presented in Table 4-23. Flow data is available for all calendar months, with a total of 90 samples available in the dataset.

Table 4-23:
Estimated Mean Monthly Load in Peace River (station PR-3.88) for Cd, Cu and Zn

Parameter	Monthly mean loads (kg)											
	JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC
	n=2	**n=1**	**n=4**	**n=10**	**n=16**	**n=12**	**n=9**	**n=5**	**n=6**	**n=16**	**n=5**	**n=4**
Cd	*28*	*29*	*73*	*347*	*258*	*101*	*74*	*188*	*81*	*69.7*	*54.7*	*46.4*
Cu	*2239*	*2300*	*3046*	*9590*	*9466*	*3167*	*2744*	*5108*	*3201*	*2470*	*3140*	*3280*
Zn	*4035*	*4035*	*6455*	*28928*	*21510*	*6792*	*6635*	*15735*	*7800*	*3510*	*3470*	*7360*

Notes: n = the number of water quality samples for a given month, data range is from April 2007 to December 2019. Values reported as less than the detection limit were set equal to the detection limit value for loading calculations.

The analysis is considered adequate to provide approximate 'order-of-magnitude' estimates of metal loads carried in the Peace River in the vicinity of the Site C Clean Energy Project, for the purpose of providing some preliminary context for the metal loads discharged from RSEM area sediment ponds. Overall, the metal load contributed from the ponds in 2019 was very minor relative to the metal loads carried by the Peace River.

5. Conclusions and Recommendations

PEACE RIVER
HYDRO PARTNERS

5. Conclusions and Recommendations

5.1 Geochemical Monitoring

The expectation that all bedrock exposed or excavated as part of the Main Civil Works Contract will be PAG, with most units expected to become acidic within one year of disturbance was confirmed by geochemical monitoring undertaken to date. Small exposures of bedrock have become acidic at several locations on both the Left Bank and Right Bank. The combined ARD/ML mitigation measures of material placement, water management and water treatment has been effective in restricting the exceedance discharge limits from water discharging to the Peace River. General observations from 2019 are noted below, followed by the conclusions from the monitoring undertaken on the Left and Right Banks.

5.1.1 General Observations

- All bedrock samples collected on both the Left Bank and the Right Bank in 2019 are AG or PAG. This excludes the samples collected along the 85th Avenue conveyor corridor, which are classified as NPAG; and
- Metals and metalloids exceeding 3x the ACA in the majority of samples include Ag, Cd, and Se. This provides an indication of metal enrichment in the excavated material; however, metal enrichment does not necessarily correspond to increased risk of metal leaching for these parameters.

5.1.2 Left Bank

- In 2019, 609,476 m^3 of PAG bedrock was excavated on the Left Bank. The majority of the material was excavated from the Central Cofferdam (455,131 m^3) and the DTIP (94,401 m^3). The remaining volumes were excavated from the DTOP (29,957 m^3), the LBEX (15,570 m^3), the Inlet Cofferdam (10,097 m^3), the Left Bank Drainage Adit (4,185 m^3), and Garbage Creek (105 m^3);
- The majority of PAG material excavated on the Left Bank in 2019 was placed in RSEM Area L5 (165,618 m^3) and the RSEM Area L5 Extension (385,843 m^3). The material placed in the Extension included 22,845 m^3 that was relocated from the RSEM Area L5 stockpile in July 2019. At the end of 2019, engineering records indicate that RSEM Area L5 and the L5 Extension contained 922,232 and 385,843 m^3 of PAG, respectively.

- PAG material was also placed in RSEM Area L6 and the Left Bank Dam Core area in 2019. A total of 45,670 m^3 of PAG material was placed in RSEM Area L6 and at the end of 2019, this stockpile contained 62,200 m^3 of PAG rock. PAG material totalling 12,345 m^3 was placed in the Left Bank Dam Core area. No PAG material had been stockpiled in this area in previous years. No new PAG material was placed in Garbage Creek in 2019 but previously placed PAG rock remains stockpiled in this area (24,120 m^3);
- The rinse pH results indicated that the majority of material exposed in RSEM Area L5 and L5 Extension remains pH-neutral. However, there is AG rock exposed along the lower edges at the southeast extent of the RSEM Area L5 stockpile and a single AG sample was collected from the RSEM Area L5 Extension in 2019;
- AG exposures remain near the northwestern edge of the LBEX, in the bluff below the LBEX, and along Bench 0;
- Samples from RSEM Area L5, the L5 Extension, RSEM Area L6, and the Central Cofferdam/Dam Core had total S > 0.5%. The dominant form of sulphur in these samples was sulphide S with relatively minor sulphate S. One sample collected in Q1 2019 from RSEM Area L6 had higher sulphate and was AG (rinse pH < 5.5). All other samples from these areas on the Left Bank were classified as PAG; and
- The 85th Avenue conveyor corridor samples had relatively low total S (≤0.28%), which was dominantly sulphate S. Based on a detailed analysis of the sulphur speciation of the samples, all samples from along the conveyor corridor are classified as NPAG.

5.1.3 Right Bank

- On the Right Bank, excavations during 2019 amounted to a total of 1,132,520 m^3 of PAG bedrock. Most of this material was produced from the Dam and Core Buttress and Core Trench (574,018 m^3) and the Approach Channel and Spillway (550,877 m^3). Relatively minor amounts of PAG material were excavated from Area 23 (2,794 m^3), Laydown Areas 32A and 32B (2,172 m^3), the RBDT (1,798 m^3), the RCC Excavation area (654 m^3), and the RSEM Area R5A Non-Contact Ditch (207 m^3);
- All of the material excavated on the Right Bank was deposited in RSEM Area R5A which, at the end of 2019, contained 5,298,254 m^3 of PAG rock. The PAG material previously deposited in RSEM Area R5B (363,618 m^3) remains covered by NPAG material;

- Overall, material placement in RSEM Area R5A has minimized the exposures of AG material at the surface through placement of overburden and fresh PAG rock. However, 19 of 87 samples collected in RSEM Area R5A in 2019 were AG samples. The location of the AG samples was used to direct placement of new material in the RSEM Area to cover the AG material and minimize the surface exposure;
- The majority of the samples from the Approach Channel were AG (52 of 79 samples). Runoff from the weathered bedrock exposed in the Approach Channel was directed to the MWTF;
- AG samples were collected from exposed bedrock at the base of the excavation in Area A (6 of 13 samples);
- The total S content of the bedrock samples collected from shale exposures and stockpiles ranged from 0.25% (Right Bank Dam Core) to 2.0% (Approach Channel) (median: 1.1%). The dominant form of sulphur in the majority of samples was sulphide S, with little or no sulphate S detected. Only three samples from the Approach Channel had a higher proportion of sulphate S relative to sulphide S, which is likely due to the presence of an acidic sulphate weathering product; and
- There is little or no potential for ARD/ML as a result of processing of the Phase 2 Crusher stockpile material, based on the work undertaken, which included ABA, solid phase elemental analysis and SFE.

5.2 Surface Water Quality Monitoring

The results of surface water quality monitoring have been used to better understand and predict the timing, magnitude and duration of ARD/ML on surface water runoff from the construction site, to measure the effectiveness of mitigation measures, and to verify compliance with EOP discharge limits. The surface water quality monitoring program is intensive and includes sampling and analysis from a dynamic set of stations across the site, and analysis of water quality samples from the RSEM Area L5, L6, R5A, R5B and R6 sediment ponds and discharges.

The surface water quality monitoring program has generally been effective. The high frequency sampling and laboratory analyses are reliable to allow trends in the RSEM area sediment ponds, and within upgradient catchments, to be identified, and the magnitude and duration of potential effects from ARD/ML to be verified.

5.3 Mitigation

Mitigation measures that are being implemented to minimize exceedances of EOP discharge limits due to ARD/ML include material management (excavating weathered rock in excavations and covering weathered rock in the RSEM R5B, RSEM R5A, RSEM L5, and RSEM L6 deposition areas), water management to contain water that may be influenced by ARD/ML, and water treatment to remove total and dissolved metals.

Material management is the primary ARD/ML mitigation strategy on site. Weathered material (material that has been exposed for several months and is becoming acidic) is monitored and periodically excavated from the construction area. In addition, material that is placed in RSEM disposal areas is monitored, and weathered material is covered with newly placed material (PAG bedrock or overburden).

Water management is a secondary mitigation strategy. Surface water quality is monitored. Contact water is generally contained within the site, or directed to RSEM sediment ponds, from which it is discharged to the Peace River. Contact water that is not anticipated to meet EOP discharge limits is retained and transferred to the pre-treatment pond. Water from this pond is treated by the Mobile Water Treatment Facility (MWTF) prior to discharge.

On the right bank the MWTF effectively treated water to remove dissolved metals and produced effluent that met the RSEM end of pipe limits. The accumulated sludge in the MWTF Sludge Collection Cells was removed by vacuum truck in February and June and transferred off-site for disposal. Removal of sludge in August, September, October and November was transferred to RSEM Area R5A stockpile.

The Left Bank waters are moderately PAG influenced, however, the RSEM L5E sediment control pond discharge only exceeded EOP limits on two occasions, in August and again in November. Water management allowed for all discharges from RSEM Area L5W and L6 sediment control ponds to meet EOP limits. In early September the L6 sediment control pond was pumped to Peace River to conduct a mixing zone study. Passive discharge from the RSEM Area L6 pond was authorized in November. PAG influenced waters from DIC, DOC and LBCD were transferred to the MWTF for treatment.

The implementation of various erosion and sediment control measures at site has reduced the frequency of TSS-related exceedance of EOP discharge limits from RSEM Area sediment ponds since the monitoring program was initiated in autumn 2016. TSS related exceedances are now typically only associated with high precipitation events.

Elevated pH in the RSEM R5B pond was observed from mid-May onwards and is attributed to influence of warmer temperatures and rapid plant growth in the pond. Treatment for elevated pH in the RSEM R5B pond upstream of the end of pipe was implemented on May 8 and continued through August. The RSEM R5B sediment control pond was drained and dredged early September to remove accumulated sediment and plant growth.

Elevated pH was also noted in the RSEM Area R6E and L6E sediment control ponds primarily due to the introduction of cement and shotcrete contact waters into the ponds. Sparging with CO_2 was implemented at the RSEM R6E pond mid-June through December and at the RSEM L5E pond and mid-September through November.

5.4 Recommendations

In its role as Qualified Professional for ARD/ML, Lorax provided a number of recommendations through 2019. These have been communicated in technical memorandums, weekly conference calls, and in email correspondence. Key recommendations are summarized for the Left Bank and Right Bank below and reflect ongoing ARD/ML management priorities.

- The geochemical monitoring program is effectively characterizing PAG rock exposures throughout the site. The program should continue with adjustments to sampling frequency and locations as site development proceeds;
- The water quality monitoring program should continue to adjust monitoring locations and frequency in tandem with site development, weather conditions and in response to monitoring data;
- The AG rock exposed in the slope on the southeast end of RSEM Area L5 should be relocated to allow for resloping of L5 to a grade that can be covered with NPAG overburden to limit the ingress of oxygen and water into the AG material. Interim measures to monitor and collect runoff in a sump at the base of the slope and transferred to the MWTF should be continued until final mitigation is implemented.
- Continued monitoring of exposed PAG in RSEM Area R5A and RSEM Area L5 should be used to direct placement of new material to limit weathering and water contact with AG material. By the end of 2020, the majority of material placement in the PAG-containing RSEMs will be complete. The RSEM design requires that the excavated bedrock is placed in 5 m thick layers and the surface compacted with 6 passes of a heavy vibratory compactor, which will limit the rate of infiltration. The final surface configuration of the RSEM should use NPAG

material rather than fresh PAG material to reduce the amount of PAG-influenced runoff and lower risk of a water treatment requirement through to the end of construction when the final mitigation will be applied, flooding of the RSEMs.

- In the event insufficient new material is available to cover exposures of AG in RSEM Area R5A prior to the 2020 spring melt, ensure there is adequate water storage available within the RSEM Area to store runoff water for transport to the MWTF, if necessary.
- The selected mitigation from LBEX Bench 0 area is water management. The strategy is to divert runoff water and seepage water from the upper LBEX benches away from Bench 0 to prevent it from coming into contact with the exposed AG. Direct precipitation is collected in sumps and transported to the MWTF. Monitoring of water in this area is recommended. It is recommended that prior to spring snow melt events, PRHP confirms that the water diversion and water management structures are intact and there is adequate storage to implement these mitigation measures.
- Material placement in RSEM Area L6 has reached capacity and a NPAG cover has been placed over the facility. It is recommended that PRHP confirm that the surface of the RSEM and adjacent areas where precipitation runoff is directed to the RSEM L6 sediment control pond are fully covered to reduce the risk from L6 discharge.
- Runoff from weathered bedrock exposed in the Approach Channel will continue to require treatment at the MWTF. Significant excavations in the Approach Channel are planned for 2020 that should reduce the area of weathered AG bedrock exposed in the Approach Channel through 2020.
- Recommended that quarterly monitoring continue for RSEM Area Sediment control ponds that are managed not to discharge.

Notes:
Discharge volume is calculated from the logged 24-hour end of pipe flow for each calendar date.
Occasionally, instantaneous flow measurements are used when logged flows are not available.

Notes:
Discharge volume is calculated from the logged 24-hour end of pipe flow for each calendar date.
Occasionally, instantaneous flow measurements are used when logged flows are not available.

Table of content

1.0 Laboratory Company Profile

Founded over 45 years ago, Bureau Veritas Laboratories is the market leader in analytical services and solutions to the energy, environmental, food and DNA industries. Our 2,200 dedicated employees proudly lead the industry in depth of technical and scientific expertise and serve customers through the only national network of laboratories. In processing over 2.4 million samples and generating in excess of 43 million results annually, we skilfully combines efficiency and customer service with rigorous science and uncompromising quality management. We are committed to success with responsibility – to its stakeholders, to its communities, and to the environment.

Our Mission is clear - We are a science company that is passionately committed to delivering good science through exceptional service.

A major focus is analytical services for an exhaustive list of environmental contaminants. Solid wastes, effluents, potable water, receiving waters, ground waters, soils, sediments, stack emissions, ambient air, plant, animal and fish tissues are analysed for everything from pH to Dioxins.

We provides these services to a wide range of customers, in North America and over 20 foreign countries. Our clients include consulting engineers, industry, businesses, all levels of government as well as private individuals.

Our laboratories function as a tight network operating under a single Quality Management System, utilizing the strengths of each and working together to ensure customer requirements are met. All major laboratories provide the full range of environmental testing services using a uniform Quality System and IT infrastructure to deliver a standardized high quality service across the country. In addition, certain locations have special areas of expertise, such as seawater analysis at our Burnaby and Bedford facilities and High Resolution Dioxin analysis in our Mississauga and Ville St-Laurent facilities.

Operating within one Laboratory Information and Quality System across Canada provides uniform report formats, management performance measurements, turnaround time measurements, corrective action management, and a number of other key performance indicators making us a reliable partner.

2.0 Quality Program

Bureau Veritas Laboratories currently employs 40 full-time Quality Assurance (QA) staff. This group reports to the Senior Quality Assurance Manager, whose responsibility it is to ensure consistency of approach and program independence from operations. The QA team is strengthened through a web-based document control and management system that ensures consistent formats while minimizing routine administrative tasks. Authorized staff have immediate secure access to all corporate and individual laboratory SOPs and support documentation.

The Quality Program is designed to comply with or exceed the data quality objectives of Industry, Canadian Regulators, United States EPA and the International Standards Organization (ISO). The QA team is assisted in performing audits with the help of many trained "internal auditors" that are composed of operations and support services personnel. This brings many benefits to the customer and to our company. These benefits include improved client and accreditation audits, increased communication between groups within our company, greater variety of work for staff and increased understanding of ISO/IEC 17025 customer and our own quality requirements.

The keys to the Quality Program are Prevention and Verification.

2.1 Prevention through Quality Assurance

Extensive control charting practices ensure that analyses with biases or which are potentially out of control are recognized early so that potential problems can be rectified before exceedences occur. Comprehensive internal audits of methods, Quality Control (QC) practices, sample analyses, and quality system elements confirm adherence to Standard Operating Procedures. Regular system reviews and a structured Continuous Improvement Program combine to provide the strongest possible Quality System.

Evaluated monthly, score carding of key performance indicators such as Proficiency Testing Performance, Corrective Action Reports, Nonconformance Reports and Method Audits, drives the Program, defining successes and highlighting areas for improvement. We also have a corporate Management of Change procedure whereby substantive changes in the laboratory are adequately reviewed, communicated and documented.

2.2 Training

Upon hire, personnel are required to participate in the Corporate New Employee Orientation Program (NEOP) where they are trained on the quality management system, Ethics & Integrity, and the Environment, Health and Safety program. In addition to their initial training, they are provided technical training, delivered by designated individuals (supervisor or senior analyst level) with comprehensive working knowledge and experience in the area they are training. To ensure full traceability and auditability, training records for all employees are maintained in our online

document control system and in the employee's personal training file, which is maintained by his/her supervisor.

Analyst competence is essential to the production of accurate data. Prior to beginning work in the laboratory, technicians and analysts are required to thoroughly understand the QA objectives and the relevant SOP. This, in conjunction with hands-on training from a senior analyst, ensures successful transfer of information is effective. Demonstration of acceptable performance on laboratory control samples or reference materials by the analyst is required for final certification to perform the method. Ongoing demonstration of capability is provided through blind performance evaluation samples, audits and annual recertification.

2.3 Customer Complaints

Formal responses are required to any customer complaints, discrepancies, deficiencies or quality issues. The deficiencies are recorded in an electronic database and cascade to the supervisor and the analyst for immediate attention. An acknowledgment of the deficiency is required within a specified timeframe accompanied by an action plan, which must include any corrective measures taken along with results of these actions. A follow-up report on the same form must be completed and returned documenting the effectiveness of the improvements implemented. If closure of the issue is not done in the required timeframe the issue is escalated to the next management level promoting prompt resolution of the issue. The effective response to client issues is score-carded as a key performance indicator.

2.4 Ethics and Data Integrity

All employees are required to undergo annual ethics training and to read and sign an Ethics and Data Integrity Agreement annually, promising to not knowingly commit an unethical act or through inaction, allow a coworker to do so. Senior management reinforces the program through presentations, discussion and written tests.

2.5 Verification through Quality Control

Public safety, environmental impact and major financial decisions are routinely based on our analytical data. Legal data defensibility is essential to these activities and is verified through a comprehensive quality control program. The protocols and procedures described below are routinely employed and are described in detail in our Standard Operating Procedures (SOPs) for analysis, laboratory practice and staff training. The quality assurance objectives are translated into specific requirements that are written into all standard operating procedures.

2.6 Quality Control Protocols

Each project is conducted under a defined quality control program. Our standard quality control protocols meet or exceed the requirements of Canadian and United States regulators. In addition

to this, most large projects have a defined Quality Assurance Project Plan (QAPP) that includes all required data quality objectives. The following table outlines the quality control practices routinely employed in all laboratories. Additional elements or different limits may be used on a project specific basis.

Elements of Quality Control		
Element	**Frequency**	**Limits***
Field QC		
Sample Containers	Precleaned to EPA Spec's	Non Detect
Traveling Blanks	Project Specific	<RDL
Field Duplicates	Project Specific	Project Specific
Run QC, All Methods		
Method Blanks	1 in 20 or 1/batch	<RDL
Blank Spikes	1 in 20 or 1/batch	CCME or Provincial limits
Matrix Spikes	1 in 20 or 1/batch	CCME or Provincial limits
Duplicates Analysis	1 in 20 or 1/batch	± 20%-50%
Real Time Control Charts	Key parameters, all tests	± 3 SD, trend analysis
Inorganic QC		
Instrument Calibration	Multipoint Daily	>0.995 correlation
Calibration Verification	Daily (second source)	± 10% of initial
Continuing Cal. Verification	Every 20 samples & at end	± 10% of initial
Standard Reference Material	Daily – As Required (if available)	SRM limits
Organic QC		
Instrument Calibration	Multipoint	RSD ± 20%
Calibration Verification	Daily (second source)	± 20% of initial
Continuing Cal. Verification	Verified every 12 hr	RF or RRF ± 30% of initial
Surrogate Standards	All samples, all organic analyses	CCME or Provincial limits
Internal Standards (IS)	All Samples (method specific)	-50% to +100% of IS in Cal'n
Standard Reference Material	As required (if available)	SRM limits
External QC		
Interlaboratory Comparisons	>50/year	Top 10% overall, >95% acceptable
Double Blind Program	Annually (Inorganic and Organic where applicable)	Statistical Limits
Internal QC Checks	As required	In house limits

* Typical QC acceptance criteria. Values may vary for specific tests.

2.7 Accreditation

Bureau Veritas Laboratories hold several accreditations granted by Canadian and United States regulatory organizations. The intent of accreditation is to document through laboratory audit, check samples, and round robin studies, each laboratory's conformance to ISO/IEC 17025, an internationally accepted quality system. The accreditation process is also an integral part of our philosophy of Continuous Improvement. The following organizations have endorsed our quality

system. These endorsements are granted on a facility specific basis. In addition, many tier one industries have audited and approved our laboratories.

- Canadian Association for Laboratory Accreditation (CALA)
- Standards Council of Canada (SCC)
- Ministère de l'Environnement et de la Lutte contre les changements climatiques (MELCC)
- National Environmental Laboratory Accreditation (NELAC)
- U.S. Environmental Protection Agency Contract Laboratory
- American Industrial Hygiene Association (AIHA)
- Various US States

2.8 Proficiency Testing

Our laboratories participate in many national and international proficiency testing and double blind check sample programs. As per ISO 17025 requirements, we are required to successfully participate in proficiency testing programs for tests included on our scope of accreditation. We go above and beyond these minimum requirements. Some of the programs we are currently participating include:

- Corporate Double Blind Program
- Canadian Association for Laboratory Accreditation (CALA)
- AWAC
- CMPT
- NWRI (Env. Canada)
- NAPT
- WUCMUC
- State of New York – Environmental Laboratory Approval Program

2.9 Double Blind Program

The Double Blind Program was implemented to measure the quality of data and service provided to customers. Proficiency testing samples are required as part of standard accreditation programs (ISO 17025), however they do not adequately simulate lab performance for client samples since the lab knows it is being tested. The double blind program involves using a sample from an accredited proficiency-testing provider and having the sample “disguised” as a client sample so the lab is completely unaware their performance is being evaluated. The sample is sent to our laboratories as a regular sample, which upon completion is assessed by the Quality Assurance Department for turnaround time (TAT), data accuracy and traceability. This program best simulates lab performance for real client samples.

2.10 Customer Service / Project Management

The quality process extends beyond accreditations, methods and staff expertise. It includes the management system for all activities from project awards to follow-up customer satisfaction

surveys. The heart of the process is the Project Management (PM) team, the largest laboratory customer service team in Canada. This team consists of dedicated professionals whose responsibility it is to ensure the customer gets the tests meeting their requirements, when promised. Project managers are also aware of current and emerging regulations and thus are able to assist customers in choosing the correct testing protocol.

Supporting the PM team is our unique Laboratory Information Management System (MaxxLIMS). MaxxLIMS tracks and monitors all project information and provides a direct link between analysis and reporting. Employing barcodes, MaxxLIMS monitors each sample's progress through the lab as it is received and logged, extracted, analyzed and the resulting data is approved, validated and reported. Comprehensive sample tracking, combined with instrument capacity and staff commitment to customer service, allows clients to be confident in our ability to deliver quality data on time. Customer feedback and PM process insight has driven a number of innovations, mostly made possible through MaxxLIMS.

- Client website access to approved data
- Client website access to project status
- On line bottle orders
- Sample integrity forms
- Custom electronic and hard copy deliverables packages.
- Regulatory reports
- Consolidated invoicing
- Project summary performance reports
- Real time, automated sample log-in and data checks

2.11 The Quality Promise

The Quality Pyramid summarizes our quality promise to our customers. Each component of the pyramid strengthens the overall customer experience and ultimately converges at a single point, the promise to deliver accurate, defensible data to our clients.

Notes:

**Rinse pH was done at 1:2 solids to liquid ratio. When done at 1:1 solids to liquid ratio, sample absorbed all water and no supernatant was formed.

[a]Net Potential Ratio is calculated using the non-sulphate sulphur acid potential.

Paste pH - Field and Laboratory Methods Applicable to Overburdens and Minesoils, (EPA 600 / 2-78-054, March 1978).

Rinse pH (on <2mm) - MEND PREDICTION MANUAL, (MEND Report 1.20.1, December 2009).

Total sulphur, total carbon & carbonate carbon (CO_2; HCl direct method) by Leco.

HCl Extractable Sulphur and HNO_3 Extractable Sulphur is based on a modified version of ASTM Method D 2492-02

HCl Extractable Sulphur is based on a modified version of ASTM Method D 2492-02

Non Extractable Sulphur = (Total Sulphur)-(HCl Extractable Sulphate Sulphur)-(HNO_3 Extractable Sulphide Sulphur)

Sulphide Sulphur = (Total Sulphur)-(Sulphate Sulphur)

TAP = Total Acid Potential = Total S x 31.25

SAP = Sulphide Acid Potential = Sulphide S x 31.25

Mod. ABA Neutralization Potential - MEND Acid Rock Drainage Prediction Manual, MEND Project 1.16.1b (pages 6.2-11 to 17), March 1991.

Net Neutralization Potential = (Modified ABA Neutralization Potential)-(Acid Generation Potential (HNO3 Extr))

Net Potential Ratio = (Neutralization Potential)/(Acid Generation Potential)

Grey shading indicates an NPR <2

Fizz Rating - Reference method used is based on NP method.

Notes:

[a]BC WQG - British Columbia Water Quality Guidelines for the Protection of Aquatic Life

[b]Hardness dependent guidelines are based on a hardness of 120 mg/L

Values shaded in light grey are above the long-term BC WQG

Values shaded in dark gray are above the short-term BC WQG
