

17 March 2021

NEW GOLD INC.
Rainy River Mine
P.O. Box 5
Emo, Ontario
P0W 1E0

Dear Mr. Baird:

Reference: 2020 Species at Risk Monitoring

Ecometrix is pleased to provide New Gold Inc. (New Gold) with the New Gold Rainy River Mine Species at Risk Monitoring Report 2020 to fulfill a portion of the requirements for the 2020 Wildlife Bird Monitoring contract with the Rainy River Mine (RRM). Ecometrix has signed a letter of intent with the Naotkamegwaning First Nation (NFN) to help build their capacity in monitoring based contracts at the RRM. Northern Bioscience was subcontracted to perform the 2020 Species at Risk Monitoring program and reporting to fulfill requirements of the 2015 Environmental Assessment and Condition 7.2(a) of New Gold's permit under the Endangered Species Act (Permit FF-C-001-14). The technical aspects of the study and the report were then reviewed by Derek Hillis, Senior Environmental Scientist with Ecometrix.

We trust that this report meets your requirements at this time. If you require any further information, please do not hesitate to contact Joe Tetreault at 905-452-4676.

Yours truly,
ECOMETRIX INCORPORATED

EXECUTIVE SUMMARY

Species at risk surveys were conducted in 2020 for New Gold's Rainy River Mine to support monitoring requirements following the 2015 Environmental Assessment per Condition 7.2(a) of Permit FF-C-001-14 under the Endangered Species Act. This report summarizes the 2020 Whip-poor-will, Bald Eagle, and Barn Swallow monitoring programs.

Whip-poor-will monitoring followed standardized methods at 24 stations previously monitored in 2018. Seven Whip-poor-wills were detected on both the June and July surveys, similar to numbers observed in 2018 (eight in June, six in July) but less than 2015 to 2017 (19, 14, and 9 respectively).

A Bald Eagle nest 1.4 km south of the mine footprint was active in 2020 with two fledged young on June 2 2020. Another nest 1.2 km west of the footprint was inactive in 2020 but remains in good repair and could be reoccupied in the future. No nesting activity was observed at Barn Swallow nesting structures. Incidental observation of Species at Risk included American White Pelican, Bald Eagle, Golden Eagle, Common Nighthawk, Barn Swallow, Bobolink, and Snapping Turtle.

1 INTRODUCTION

The New Gold Rainy River Mine (RRM) is in Chapple Township, approximately 65 kilometres northwest of Fort Frances, in northwestern Ontario (Figure 1). This report summarizes species at risk surveys conducted in 2020 for the RRM to support monitoring requirements following the 2015 Environmental Assessment per Condition 7.2(a) of Permit FF-C-001-14 under the Endangered Species Act.

Surveys targeted Eastern Whip-poor-will (*Antrostomus vociferous*), Barn Swallow (*Hirundo rustica*), and Bald Eagle (*Haliaeetus leucocephalus*) and followed methods used in previous monitoring sessions (Wood 2019).

The bat species, Little Brown Myotis and Northern Myotis are both classified as endangered both provincially and federally and were part of the monitoring at the site. The methods and results of the bat monitoring are provided under separate cover.

2 METHODS

Fieldwork related to Whip-poor-will, Bald Eagle and Barn Swallow was completed on June 1-2 and July 2-3 2020 by Allan Harris and Brian Ratcliff of Northern Bioscience at survey points previously sampled by Wood (2019).

2.1 Whip-poor-will Monitoring

Whip-poor-will surveys were completed on June 1 and July 2 2020 at the 24 survey points near the mine site footprint, referred to as the peripheral area, that were sampled in previous years (Wood 2019). Survey locations are shown on Figure 2.

Methods followed the *Whip-poor-will Roadside Survey Participant's Guide* (BSC 2012). Surveys started at least 30 minutes after sunset on calm, clear nights with little or no cloud cover, no precipitation and winds of no greater than 3 on the Beaufort Scale. Survey coordinates, weather conditions, and times are summarized in Appendix 1 and Appendix 2. Moon phase, sunset times, and moonrise times on the survey dates are summarized in Table 1.

Surveys lasted six minutes at each station. Distance and direction to calling Whip-poor-wills were estimated.

Table 1. Sunset and moonrise times during 2020 Whip-poor-will surveys.

Time	June 1	July 2
Sunset	21:08	21:17
Moonrise	15:58	19:00
Moonset	03:21	03:08
Full Moon Date	June 5	July 4

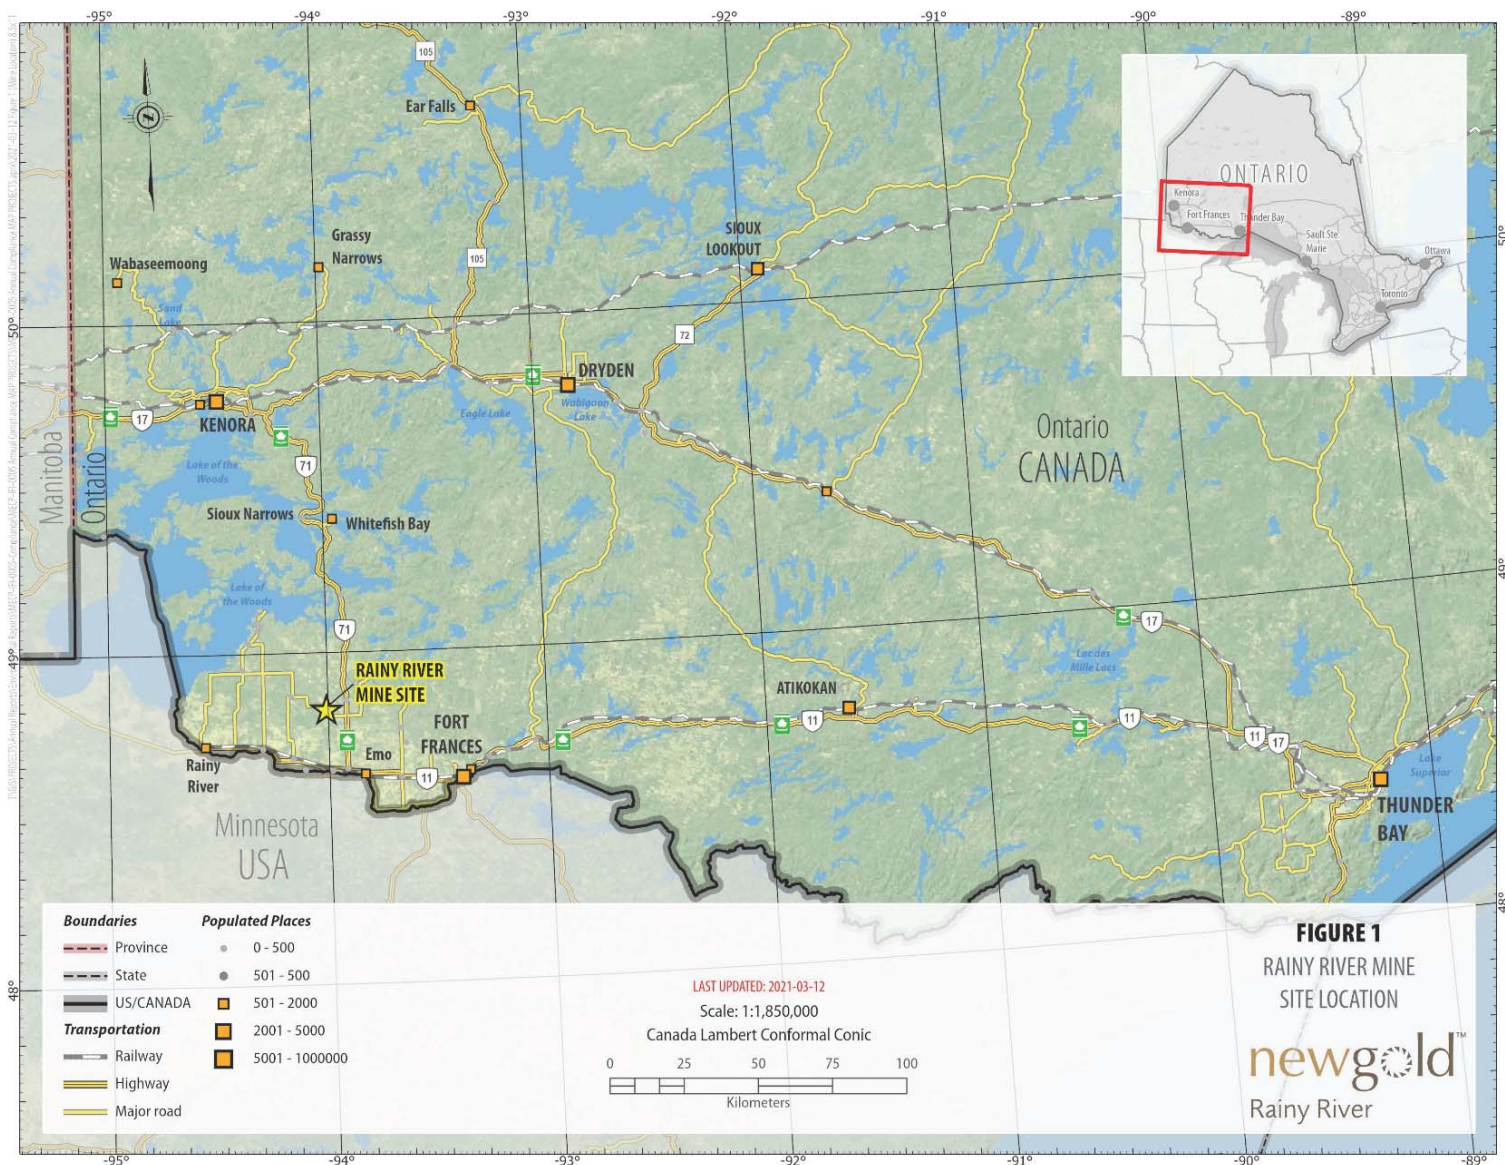

Figure 1. Location of the New Gold Rainy River Mine.

2.2 Whip-poor-will Sound Monitoring

Condition 4.2 (b) and 6.2 (c) of the ESA permit require an acoustic audit accompany the Whip-poor-will monitoring studies. The audit is conducted to determine whether activity at the mine site results in sound levels exceeding 50 dBA (on a 1-hour basis).

The permit stipulates that acoustic monitoring is to occur in the first week of May and June; however, the timing for the 2020 acoustic audit coincided with there being a State of Emergency in Ontario due to the COVID-19 pandemic. As such there were complications with planning of field activity leading up to the first week of May, resulting in the May window being missed. The sound monitoring data was collected in the June measurement window with another round of measurements completed at the beginning of July. According to the Ministry of Environment Conservation and Parks (MECP), the nesting season of the Eastern Whip-poor-Will may extend from mid-May to the end of July.

Acoustic monitoring was conducted at one location north and one location south of the mine site as shown in Figure 1 of the Acoustic Audit Report (IEC 2020). Sound levels were measured on a 15-minute basis throughout the program using Larson Davis 831C sound level meters. The meters were factory calibrated in February 2019 and were field calibrated at the start and end of each recording timeframe. Meters were set with an “event trigger” of 50 dBA to facilitate interpretation of any exceedances. Sound results, in particular any exceedances of the 50 dBA threshold were cross-referenced with the meteorological data collected at the site to remove exceedances not resultant from mine activity. The full acoustic audit report is provided in Appendix 3.

2.3 Bald Eagle Nest Monitoring

Two previously documented Bald Eagle nests on Highway 600 near Blackhawk and on Jones Road (Figure 3) were monitored for activity on June 2 and July 2 2020. The nests were observed from the nearest roadside and scanned for evidence of nesting for 30 to 45 minutes using binoculars and a spotting scope. Nest coordinates are provided in Appendix 4.

2.4 Barn Swallow Monitoring

New Gold staff conducted monitoring of Barn Swallow nest structures (Figure 3) on May 22, June 22, July 23, and Aug 13 2020. Nest structure coordinates are provided in Appendix 4. Structures were examined for the presence of nests, Barn Swallow activity in the area, and evidence of predators at the structures.

Three Barn Swallow nesting structures (A, C, and D on Figure 3) were checked for activity on June 2 and July 3 2020 by Northern Bioscience. The structures were observed from the nearest roadside and scanned for Barn Swallow activity for 30 to 45 minutes using binoculars and a spotting scope.

2.5 Other Species at Risk Observations

Other Species at Risk observations within the study area were recorded incidentally by New Gold staff and contractors and during the 2020 Whip-poor-will and bat surveys (Appendix 5).

2.6 Species at Risk Training

According to Condition 4.3 (a) of the ESA permit, awareness training is provided to all staff via electronic modules prior to working for New Gold on site. According to Condition 4.3 (b) a record of this Species at Risk awareness training provided to staff in 2020 is summarized in Appendix 6.

2.7 Equipment Operating Hours Monitoring

In 2020, the mine was in full operation with a daily average of 139,702 t/day of ore and waste mined and an average daily throughput at the mill of around 24,100 t/day. Normal activities involved in mining operations included the use of heavy equipment such as bulldozers, haul trucks, shovels and graders. New Gold tracks some of their fleet using on-board GPS and operating hour recordings. A record of the operating hours for this tracked equipment in 2020 is summarized in Appendix 7. This summary is a subset of New Gold's equipment with contractor hours and non-tracked equipment in addition to the provided summary.

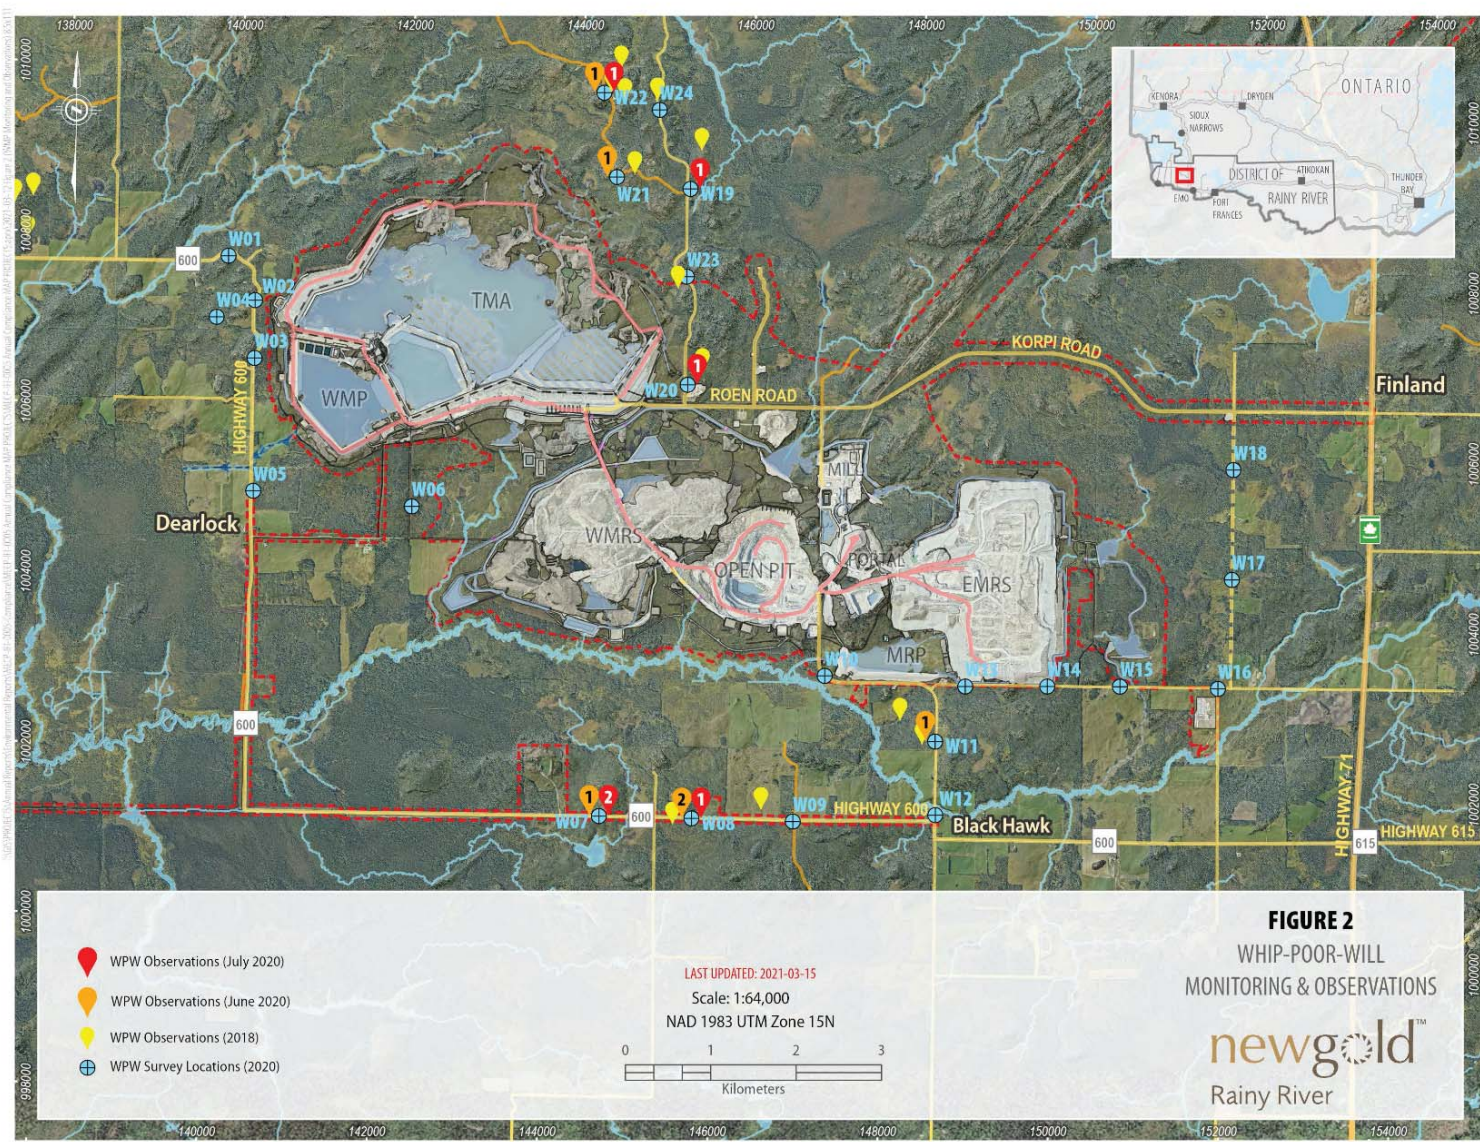

Figure 2. Whip-poor-will monitoring sites and observations New Gold 2020.

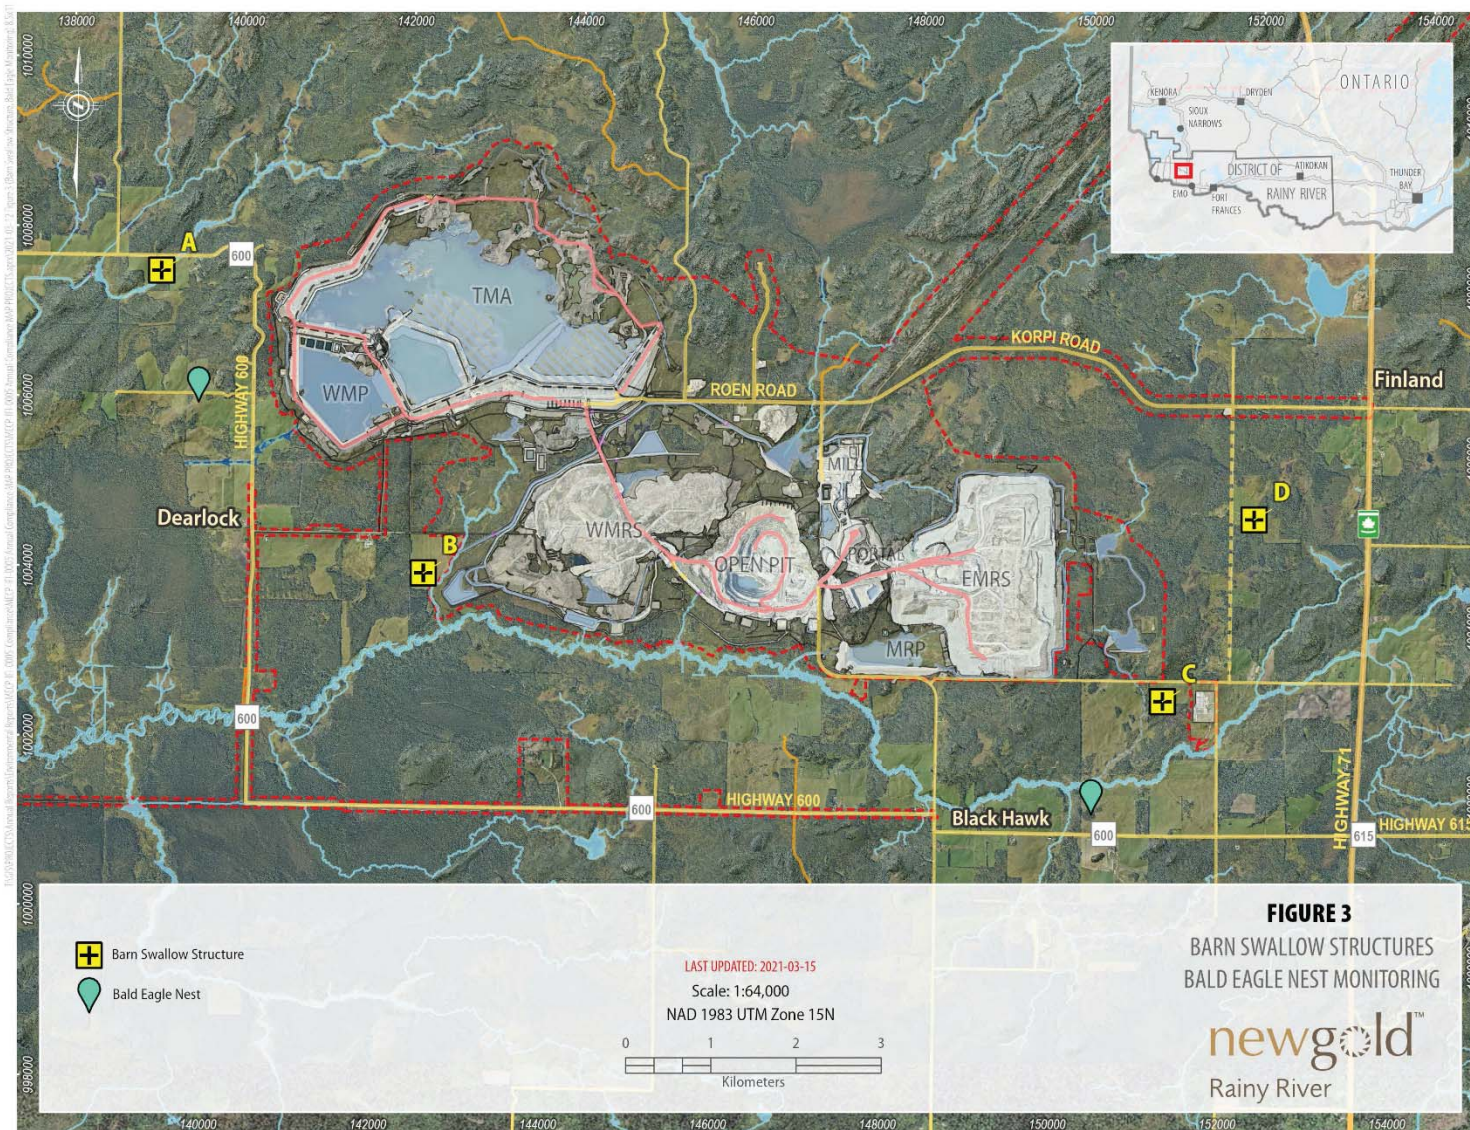

Figure 3. Barn Swallow structures and Bald Eagle nest monitored at New Gold in 2020.

3 RESULTS AND DISCUSSION

3.1 Whip-poor-will Monitoring

Seven Whip-poor-wills were recorded during each survey in 2020 (Table 2). Whip-poor-wills were detected at a total of eight stations although only three stations (W07, W08, W22) had birds on both surveys. Two different Whip-poor-wills were recorded at W7 (visit 2), W8 (visit 1), and W22 (visit 2). Mine noise impaired the ability to hear Whip-poor-wills at some stations, particularly W9, W10, W13, and W14 as did calling frogs at W2, W3, W4, W5, W6, and W17 (visit 1) (Appendix 2).

Whip-poor-wills were detected in similar numbers in 2018 and 2020 (Table 2). In both years, activity was clustered south of the mine at stations W7 to W11 and north at stations W19 to W24 (Figure 2). No Whip-poor-wills were detected at stations to the east and west of the mine footprint in either year.

Whip-poor-will numbers did decline before 2018. A total of 19, 14, and 9 Whip-poor-wills were recorded in 2015, 2016, and 2017 respectively at the same survey stations (Wood 2019). These results suggest that Whip-poor-wills declined close to the mine until the site reached its full footprint around 2018 when the numbers apparently stabilized. Continued monitoring will help clarify this trend. Alternatively, Whip-poor-wills declined by 3.36% annually in Ontario between 2002 and 2012, probably due to reduced availability of insect prey and agricultural practices in the winter range in Mexico and Central America as well as the North American breeding range (Ministry of the Environment, Conservation and Parks 2019). The decline at the RRM site may reflect this range-wide decline rather than mine related effects

Table 2. Summary of Eastern Whip-poor-will observations 2018 and 2020. 2018 data are from Wood (2019).

W22	2	2	1	2
W23	1	0	0	0
W24	2	0	1	0
Total	8	6	7	7

3.2 Whip-poor-will Sound Monitoring

A total of five of the 334 hours of measured acoustic data were in excess of the 50 dBA threshold at each monitoring location following removal of exceedances that resulted from meteorological events. A review of these five remaining hours indicated that those exceedances were not the result of New Gold operations but rather were the result of bird calls in the immediate vicinity of the sound recording microphones. Therefore, none of the exceedances of the 50 dBA on a 1-hour basis were the result of the RRM operations and the mine remained in compliance with that condition. No additional acoustic mitigation is required at this time.

3.3 Bald Eagle Nests

The Bald Eagle nest at Blackhawk had two chicks on June 2 2020 (Figure 3). The chicks were fully feathered out and flapping wings (Figure 4). The nest was empty on July 2 2020.

The nest on Jones Road had no sign of adults or young on June 2 or July 3 2020 (Figure 5). No guano was present (branches would be white if chicks present) indicating that it was not successfully used in 2020. The nest was still in good repair so could be reused.

The successful nesting at the Blackhawk site indicates that the Bald Eagles are tolerant of the levels of noise and human activity at the mine site. The Jones Road nest may be reoccupied since Bald Eagles often have two or more nests that they use in alternate years.

3.4 Barn Swallow Nesting Structures

Results of the 2020 Barn Swallow surveys are summarized in Table 3. No nesting activity was observed at any of the nest structures. A small amount of nesting material at C4 and the remains of last year's nests at D4 and D6 indicate that Barn Swallows have discovered and investigated the structures but have not nested successfully. On June 2, several Barn Swallows were visiting a garage at an old homestead near structure D and collecting mud (nesting material) from puddles (Figure 6), suggesting that they were nesting in the garage.

The failure of Barn Swallows to use the nest structures may reflect the high availability of preferred nest sites on barns, houses, and other structures in the area. Buildings are often used colonially (COSEWIC 2011) and nest site availability is therefore unlikely to limit the local population size.

3.5 Other Species at Risk Observations

The following observations were made (also see Appendix 5):

- American White Pelican (listed provincially as Threatened, not listed federally) on 13 dates between April 23 and August 14.
- Bald Eagle (listed provincially as Special Concern, not listed federally) on 19 dates mostly in winter, spring, and fall.
- Golden Eagle (listed provincially as Endangered, not listed federally) on October 1.
- Common Nighthawk (listed as Special Concern provincially and federally) on June 1 during Whip-poor-will survey
- Barn Swallows (listed provincially and federally as Threatened) on seven dates between May 20 and August 17
- Bobolink (listed provincially and federally as Threatened) on May 22 and May 27
- Snapping Turtle (listed as Special Concern provincially and federally) on June 12 at the Pinewood Pumphouse (which is inactive)

3.6 Species at Risk Training

Species at Risk training was provided to 2,183 staff and contractors on 320 dates in 2020 (Appendix 6).

3.7 Equipment Operating Hours in 2020

Equipment operating hours in 2020 are summarized in Appendix 7. As mentioned this number of operating hours is only for the heavy machinery that is tracked on site. Overall, the number provided accounts for approximately 40% of the total large machinery hours in 2020.

APPENDICES

Appendix A: Sound Level Data Tables

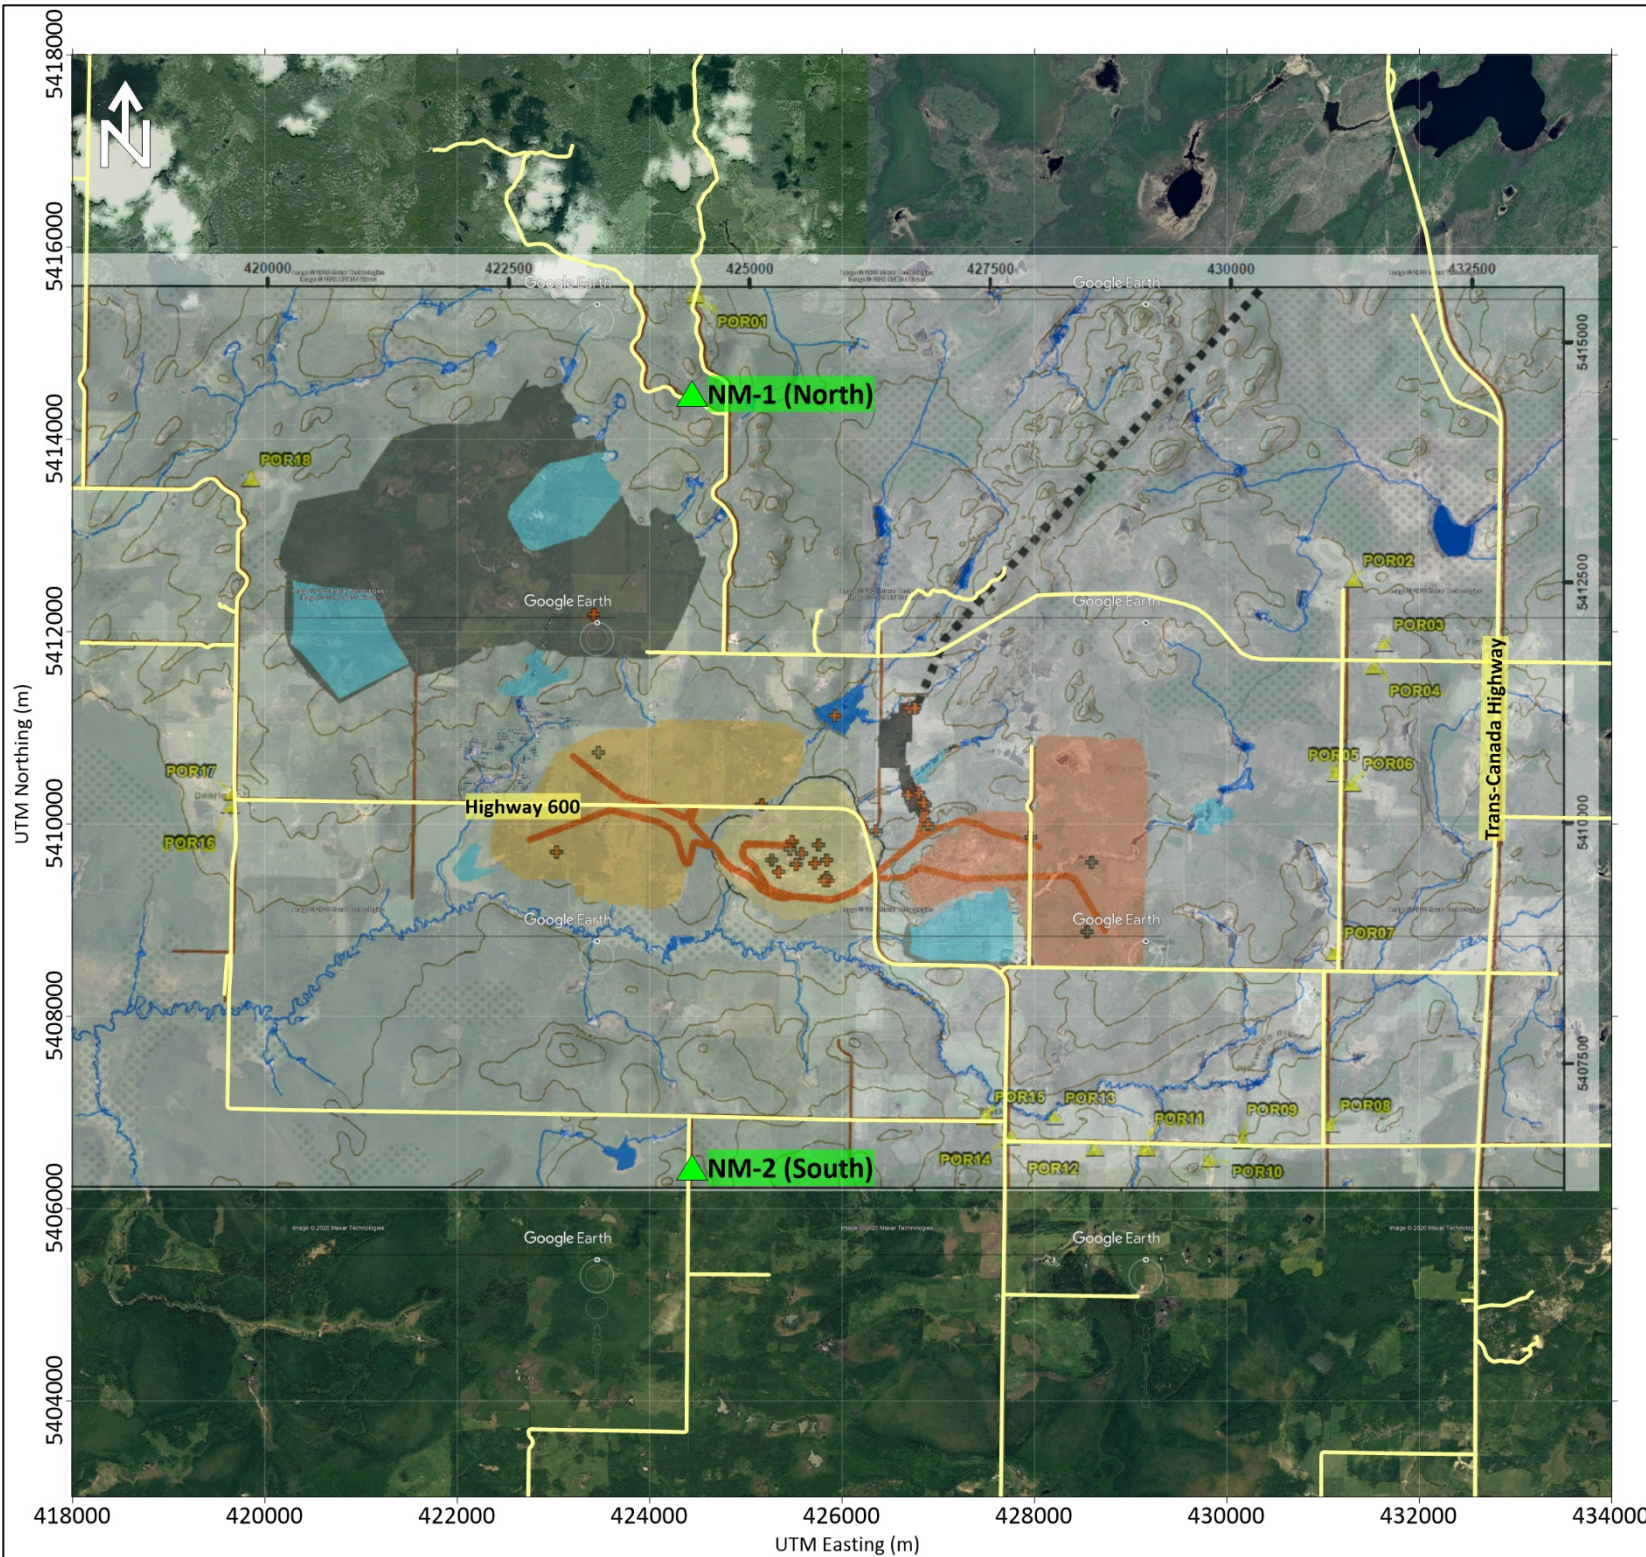

1.0 INTRODUCTION

Independent Environmental Consultants (IEC) was retained by New Gold Inc. to assist in the completion of an ambient sound monitoring study in the vicinity of the Rainy River Mine. This is part of an acoustic auditing program that is required under the *Endangered Species Act*, as stipulated by the Ontario Ministry of Natural Resources and Forestry (MNR) in an *Overall Benefits Permit* issued to the New Gold Rainy River Mine (Permit No. FF-C-001-14). The permit is now controlled by the Ontario Ministry of Environment, Conservation and Parks (MECP). In accordance with the permit, sound level monitoring is to take place at locations identified as known habitat for Eastern Whip-poor-will. This report provides an overview of the operations at the Rainy River Mine site, details of the surrounding area, MECP requirements pertaining to the Eastern Whip-poor-will habitat sound monitoring program, as well as details and results of the monitoring program.

2.0 SITE AND SURROUNDING AREA

The Rainy River Mine is located approximately 65 km northwest of Fort Frances in northwestern Ontario and consists of an open-pit and underground mine as well as an ore processing facility located on-site. Other site infrastructure includes the tailings management area, various stockpiles (e.g., overburden, waste rock), on-site roads for access and haulage of ore material, and buildings for supporting operations (e.g., administration, maintenance). Operations at the site in 2020 included blasting, dam construction, crushing, loading, hauling, dumping, and rock placement.

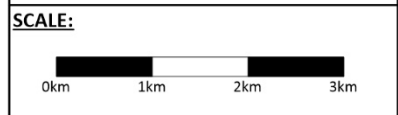

The lands surrounding the mine site are generally forested areas, with some farmlands throughout. Of particular relevance to this study is the presence of an Eastern Whip-poor-will habitat adjacent to the mine lands. The Eastern Whip-poor-will are considered a Threatened Species per *Ontario Regulation 230/08* under the *Endangered Species Act* and are known to be particularly sensitive to noise. With regards to sources of noise that are present in the area other than those associated with mine operations, it should be noted that there are several highways in the area including the Trans-Canada Highway, Highway 600, and Highway 617. There is also a CN rail line located approximately 16 km to the south of the Eastern Whip-poor-will habitat. Refer to Figure 1 for an illustration of the site location in relation to the relevant features of the surrounding area.

3.0 REGULATORY CONTEXT

As noted previously, there is an Eastern Whip-poor-will habitat adjacent to the mine lands, which have been identified by the MNRF as a Threatened Species. As a result, the MNRF have issued an *Overall Benefits Permit* (No. FF-C-001-14) to New Gold for the Rainy River Mine, which is now controlled by the MECP. This permit outlines measures for the protection of this species. Included in the permit is a requirement to complete periodic acoustic monitoring at the Eastern Whip-poor-will habitat and determine whether activity at the mine site results in sound levels exceeding 50 dBA (on a 1-hour basis).

The monitoring requirements differ depending on the stage of activity at the site (e.g., construction, operations). During construction activity, the monitoring is required on an annual basis, while during operations the monitoring is to be completed in 2-year intervals. As noted in Section 2.0, the mine was in the Operations stage at the time that the monitoring was completed. It should be noted that the permit stipulates that acoustic monitoring is to occur in the first week of May as well as in June; however, the timing for the 2020 acoustic audit coincided with there being a State of Emergency in Ontario due to the COVID-19 pandemic. As such there were complications with planning of field activity leading up to the first week of May, resulting in the May window being missed. The sound monitoring data discussed in this report was collected in the June measurement window. In order to make up for the missed measurements in May, another round of measurements was completed at the beginning of July. According to the MECP, the nesting season of the Eastern Whip-poor-will may extend from mid-May to the end of July (1).

4.0 MEASUREMENT PROGRAM

The sound level measurement campaigns were completed over the following periods:

- June 8th to June 15th, 2020; and
- July 4th to July 13th, 2020.

As per the requirements of the Permit, the sound monitoring was conducted at two locations, representing the “north” and the “south” Eastern Whip-poor-will habitats (see Figure 1). The north and south monitors are identified as NM-1 and NM-2, respectively, in the discussion in this report and the coordinates are provided in Table 1.

Table 1: Noise Monitoring Locations

Monitor ID	Monitor Location	Monitor Coordinates (UTM, Zone 15)	
		Easting (m)	Northing (m)
NM-1	Noise Monitoring Location 1 (North)	424444	5414473
NM-2	Noise Monitoring Location 2 (South)	424444	5406426

The measurement equipment was deployed in the field by New Gold staff, with technical input, guidance and data analysis provided by IEC. The sound level meters were set up with internet connectivity to each meter to allow IEC to configure the meter settings remotely. The remote accessibility was also beneficial for completing regular equipment checks (to ensure continued operation of the meters), as well as to periodically download

data during the course of the program. This allowed intermittent analysis to determine whether the criterion of 50 dBA (1-hr Leq¹) was being exceeded.

Sound levels were measured on a continuous 15-minute basis throughout the measurement program, using Larson Davis 831C sound level meters. To assist in the analysis, the meters were also configured with an “event trigger” that provided more detailed sound level information in instances where sound levels above 50 dBA were measured. This included sound recording to assist with identifying the source of noise that caused the sound level of 50 dBA to be exceeded (though it should be noted that an instantaneous exceedance of 50 dBA does not necessarily mean that the energy equivalent for the entire hour will exceed 50 dBA). In instances where adverse meteorological conditions, or sounds of nature (e.g., birdsong) were found to have caused the elevated sound levels, the associated data point was discarded as unrepresentative of sound from operations at the mine site.

New Gold operates a meteorological station at the Rainy River site, which collected data concurrently with the sound level meters. As sounds due to certain meteorological events may result in elevated sound levels, ambient noise measurement data is subject to validation to ensure that data points associated with unrepresentative conditions are removed from the analysis. The Ontario MECP outlines requirements for noise monitoring programs, including meteorological considerations, in Publications NPC-102 (2) and NPC-103 (3). In addition, the sound level meter manufacturer also outlines limitations regarding the performance of the instrument under certain meteorological conditions (4). The meteorological conditions that were applied in the validation of the measurement data are summarized in Table 2.

Table 2: Parameters for Meteorological Validation

Meteorological Parameter	Limiting Condition
Temperature	-10° C to +50° C
Relative Humidity	25% to 90%
Wind Speed	<18 km/hr
Precipitation	No precipitation during measurement
<p>Note: Based on feedback from the equipment supplier, the adjustment for sound levels collected above the ceiling relative humidity level of 90% is relatively insignificant and data would only need to be discarded if there were condensation occurring. As there did not appear to be any anomalous data associated with the sound levels at humidity levels above 90% these points were kept for a more complete data set.</p>	

The sound level meters were last factory calibrated to an NIST-traceable standard in February 2019. In addition, the sound level meters were each calibrated in the field before and after the program, using a handheld CAL200 calibration device. The field calibrations did not result in any significant adjustment. The meters were deployed with environmental protection and were sited in accordance with NPC-102/103, which requires that the

¹ The *energy equivalent sound level* (Leq) is a metric used for the analysis of environmental noise, and accounts for the tendency of environmental noise to vary with time. The Leq is the constant sound level over a period (t) that contains the same sound energy as the time-varying sound over the same period (t).

microphone be located greater than 1 m above the ground and greater than 1 m away from any reflecting surface. The environmental protection included a wind screen equipped with bird spikes (to deter birds from perching on the microphone), and a heated preamplifier to control the effects of humidity. The sound level meter was stored in a weather-proof hard case, with the preamplifier and microphone attached to a tripod via a microphone extension cable from the hard case.

By the completion of the monitoring period, all sound level data and meteorological was compiled and analyzed for comparison to the 50 dBA sound level threshold.

5.0 MEASUREMENT RESULTS

Measurements at the two monitoring locations were completed simultaneously in each campaign, and were synced such that both monitors were logging data for the same intervals of time. As noted previously, the meters were each configured to log sound levels on a continuous 15-minute basis. This time step allowed for additional information on what was occurring within each hour; however, ultimately the sound levels were log-averaged on an hourly basis for comparison to the meteorological data (for validation) and to the sound threshold of 50 dBA.

The June campaign ran continuously for 8 days, resulting in 192 logged hourly measurements at each location. Upon comparison to the meteorological data set, a total of 67 hours were removed due to rain and/or high winds, leaving 125 hours of valid data. This is well above the minimum number of hours for an ambient noise monitoring study of 48 hours as stipulated by the MECP in its Publication NPC-300. The July campaign ran for 10 days, resulting in 240 logged hourly measurements at each location. The meteorological validation resulted in 31 hours being discarded, resulting in 209 hours of valid data.

5.1 JUNE CAMPAIGN

After the meteorological validation, it was found that all hourly sound levels at NM-1 were below the sound level threshold of 50 dBA; while at NM-2 there were two (2) hourly sound level that exceeded 50 dBA. The sound recordings collected as a result of the event trigger were reviewed to determine whether sound attributable to mine activity was occurring; however, it was found in both cases that the sounds were dominated by bird calls occurring close to the meter. As such, these two measurements were removed from the data set. The final results of the June monitoring program are summarized in Table 3.

A full summary of the hourly monitoring data is provided in Figure 2 and Figure 3, inclusive of the points that were invalidated for completeness of record (the invalid data points are identified using a different marker than the valid points). A corresponding data table is provided in Appendix A.

5.2 JULY CAMPAIGN

After the meteorological data validation, it was found that there were five (5) hourly measurements out of 209 that exceeded the hourly Leq threshold of 50 dBA at NM-1, and three (3) at NM-2. The sound recordings collected with the measurement data were used to identify what was occurring during these hours. In each case, it was found that the sounds were dominated by bird calls occurring close to the meter. As such, these data points were removed from the data set. A summary of the final monitoring results from the July 2020 campaign are summarized in Table 4.

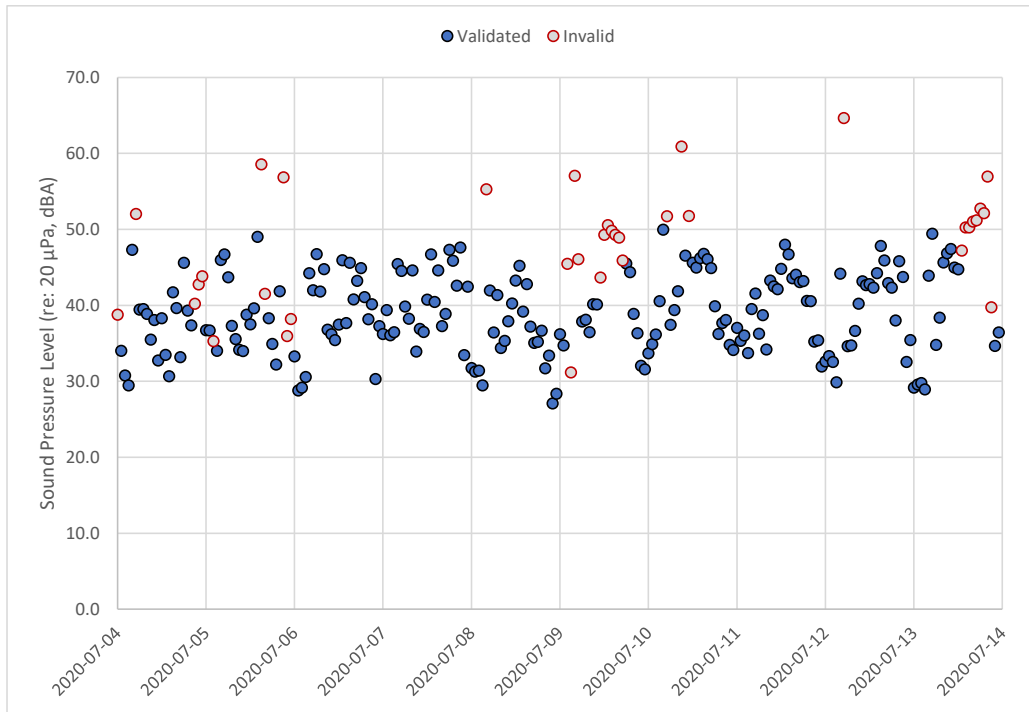

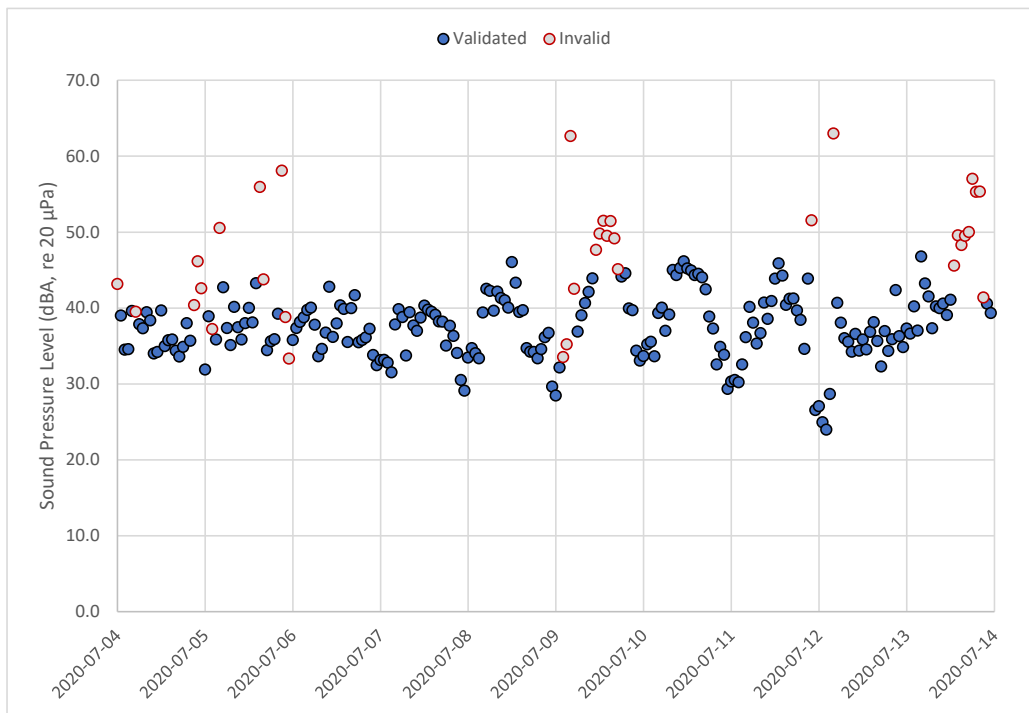

Figure 5: Noise Monitoring Summary at NM-2 (July 2020)

6.0 CONCLUSIONS

In accordance with the *Overall Benefits Permit* issued to the New Gold Rainy River Mine (Permit No. FF-C-001-14), noise monitoring of the Eastern Whip-poor-will habitat in the vicinity of the Rainy River Mine was completed in 2020. While the permit specifically identifies that the monitoring take place during the first week of May and in June, the announcement of a state of emergency in Ontario due to the COVID-19 pandemic interfered with efforts to complete the May measurements. Measurements were completed in June, in accordance with the permit, and another round was completed at the beginning of July. It should be noted that the Ontario MECP has identified that nesting season for the Eastern Whip-poor-will typically extends into July, and sounds of the Eastern Whip-poor-will were recorded during the July program.

Activities being completed at the Rainy River Mine during the measurement campaigns included blasting, dam construction, crushing, loading, hauling, dumping, and rock placement. As per the Overall Benefits Permit, the noise monitoring is to indicate whether operations at the mine contribute to sound levels at the Eastern Whip-poor-will habitat at levels exceeding 50 dBA on a 1-hour basis (i.e., 1-hour Leq). The results of the measurements were first validated against concurrent meteorological measurement data, and then against sound recordings triggered by any exceedances of the 50 dBA threshold on an instantaneous basis. The resulting data sets for the June and July campaigns were each well in excess of the minimum of 48 hours of measurement data required by the MECP for continuous measurement programs.

A total of five (5) out of 334 hours were in excess of the 50 dBA threshold at each monitoring location after the meteorological validation step (not necessarily the same hours). Sound recordings for each of these hours were reviewed to determine whether the operations at the Rainy River Mine were audible; however, in each instance the dominant sound was bird calls which appeared to be sounding very close to the microphones. As such, these hours were removed from the data set as they were not representative of Rainy River Mine operations. This resulted in all other hourly sound levels remaining below the 50 dBA threshold.

Appendix 4. Bald Eagle nest and Barn Swallow monitoring locations.

Station	UTM Easting	UTM Northing	Notes
BARS A	418713	5413303	South of Hwy 600 east of North Branch
BARS B	421756	5409777	South of Hwy 600 east of Dearlock
BARS C	430541	5408315	South of Teeple Road
BARS D	431385	5410364	East of Gallinger Road
Bald Eagle nest 1	429112	5407197	Blackhawk
Bald Eagle nest 2	418997	5411668	Jones Road

Appendix 5. Other Species at Risk observations, 2020.

Date	Species	Number Observed	Provincial ESA Designation	Federal SARA Designation	Comments
10-Jan-20	Bald Eagle	1	Special Concern	-	Flying at Eluik Rd.
03-Mar-20	Bald Eagle	2	Special Concern	-	Roosting a Tree on Teeple Pond
30-Mar-20	Bald Eagle	2	Special Concern	-	Roosting in a Tree at End of WCD
07-Apr-20	Bald Eagle	2	Special Concern	-	Sitting near open water at SW29
09-Apr-20	Bald Eagle	3	Special Concern	-	Flying - Mine Rock Pond
23-Apr-20	American White Pelican	5	Threatened	-	Flying - Clark Pond
05-May-20	Bald Eagle	1	Special Concern	-	Flying - Pinewood Pumphouse
05-May-20	American White Pelican	5	Threatened	-	Roosting - MRP
07-May-20	American White Pelican	1	Threatened	-	Fighting the wind within cell2
20-May-20	Barn Swallow	20	Threatened	Threatened	Flying - Neilson House
20-May-20	Barn Swallow	5	Threatened	Threatened	Flying at Marr Rd.
20-May-20	American White Pelican	10	Threatened	-	Floating in Mine Rock Pond
22-May-20	Barn Swallow	10	Threatened	Threatened	Flying around the buildings at OB19
22-May-20	Bobolink	1	Threatened	Threatened	Flew up from ground at OB18
26-May-20	American White Pelican	15	Threatened	-	Flying - over admin
26-May-20	American White Pelican	2	Threatened	-	Sitting by water - WMP
27-May-20	Bobolink	1	Threatened	Threatened	Chasing Something - Hwy 617 By Neilson Rd
01-Jun-20	Common Nighthawk	1	Special Concern	Special Concern	Heatwole Rd at Teeple Rd during Whip-poor-will survey
02-Jun-20	American White Pelican	21	Threatened	-	Flying - Marr site
03-Jun-20	Barn Swallow	1	Threatened	Threatened	Flying - Truck wash
03-Jun-20	American White Pelican	4	Threatened	-	Floating - Mine Road Pond
09-Jun-20	American White Pelican	4	Threatened	-	Swimming - Stockpile Pond
12-Jun-20	Barn Swallow	10	Threatened	Threatened	Flying - Neilson house
12-Jun-20	Snapping Turtle	1	Special Concern	Special Concern	Sunning on Pumphouse Gravel Pile
22-Jun-20	Barn Swallow	10	Threatened	Threatened	Mix of cliff and barn swallows - OB19

Date	Species	Number Observed	Provincial ESA Designation	Federal SARA Designation	Comments
22-Jul-20	American White Pelican	2	Threatened	-	Flying - Sediment Pond 3
11-Aug-20	American White Pelican	2	Threatened	-	Flying - Eluik gate
11-Aug-20	American White Pelican	3	Threatened	-	Flying - Over admin building heading west.
13-Aug-20	Bald Eagle	2	Special Concern	-	Roosting in trees at Sed Pond
14-Aug-20	American White Pelican	6	Threatened	-	Swimming - MRP
17-Aug-20	Barn Swallow	20	Threatened	Threatened	Flying - Neilson House
26-Aug-20	Bald Eagle	1	Special Concern	-	Soaring west of WMP
11-Sep-20	Bald Eagle	1	Special Concern	-	Roosting on hydro Pole on MRP
21-Sep-20	Bald Eagle	1	Special Concern	-	Roosting
29-Sep-20	Bald Eagle	1	Special Concern	-	Roosting on a pole - LD7
01-Oct-20	Bald Eagle	20	Special Concern	-	Feeding on a dead deer - Gallinger Rd.
01-Oct-20	Golden Eagle	1	Endangered	-	Roosting in tree near dead deer
26-Oct-20	Bald Eagle	1	Special Concern	-	Eating Deer Carcass
27-Oct-20	Bald Eagle	1	Special Concern	-	Eating Deer carcass, roosting in tree and sitting on side of the road
