## 1.0 INTRODUCTION

Prodigy Gold Inc. (Prodigy), a wholly-owned subsidiary of Argonaut Gold Inc., is proposing the construction, operation, decommissioning and closure of the Magino Gold Mine Project (the Project), situated at a past-producing mine site. A draft application package for an Environmental Compliance Approval (ECA) focused on activities to take place during the construction phase of the Project has been prepared by Wood Environment & Infrastructure Solutions (Wood), and was submitted to the Ministry of Environment, Conservation and Parks (MECP) on August 20, 2019 for a pre-submission review and discussion.

## 2.0 PROJECT DESCRIPTION

The Magino Project site ('Site') is a brownfield, past producing mine site. The most recent mining was completed in 1992, when the site was placed in care and maintenance. The site is accessed via Goudreau Road from Dubreuilville. Prodigy proposes the Project to include the construction, operation and closure of an open pit gold mine, with approximately 150 million tonnes (Mt) of ore and approximately 430 Mt of mine rock and associated infrastructure, to be developed on the historic mine footprint. The Project was designed to utilize the brownfield site area and infrastructure already in place at the site as practical, in order to minimize new environmental disturbance.

The Project will include an Open Pit, milling and processing complex, roads and pipelines, ore processing plant, a tailings management facility (TMF) and mine rock management facility, and stockpiles for the storage of overburden and waste rock.

Prodigy has completed a standard Environmental Assessment (EA) under the *Canadian Environmental Assessment Act, 2012* (CEAA 2012). Consultation and engagement was conducted during preparation of the Environmental Impact Statement Report with a wide range of stakeholders and Indigenous groups through various methods to gather feedback on the Magino Gold Project and the preliminary environmental assessment findings. Comments received during the draft Environmental Impact Statement Report reviews were responded to and as appropriate, addressed in the final Environmental Impact Statement Report. On January 24, 2019, the federal Minister of Environment and Climate Change issued a positive decision on the EA, determining that the Project was not likely to cause significant adverse environmental effects as per CEAA (2012).

In consultation with the Province of Ontario, the Ministry of Natural Resources and Forestry (MNRF) Class EA for Resource Stewardship and Facility Development Projects (RSFD) was applied to the project since the Magino site is a former mine site. Prodigy submitted a revised project description to MNRF in November 2016. On March 13, 2019 the MNRF issued the Approval of the Statement of Completion (Category B Project) and Prodigy was notified that MENDM would be applying the Ontario 'One Window' permitting coordination process to enable project permitting to proceed.

### 2.1 New infrastructure

Figure 1 provides the current Site plan for the proposed Magino Project. The major components of Magino Project are:

- Open Pit mine;
- Ore processing plant;
- Mine Rock Management Facility (MRMF);
- Overburden stockpiles;

- Ore stockpiles
- Tailings Management Facility (TMF);
- Site bypass road / ring road; and
- Water management infrastructure.

## 2.2 Fate of Brownfield areas

Existing brownfield areas will largely be overprinted by the development of the Open Pit, including the historic underground mine workings.

The existing tailings pond and polishing pond facilities cover an area of approximately 16 ha and 4.8 ha, respectively. Existing tailings will be tested to determine if they can be re-processed. The tailings will be excavated and hauled to the process plant for re-processing for gold as appropriate. In the event that these tailings are not reprocessed, they will be incorporated into the new TMF. The existing Provincially permitted tailings facility and polishing pond will initially be used for construction water management and storage in support of operations startup as these features are currently designated as a part of the existing Certificate of Authorization (C of A) – Industrial Sewage Works (CofA #4-0115-88-896). Portions of the area covered by the tailings facility will be incorporated into the Project facilities.

All rock used for the construction of the Project components will be sourced from the open pit, and potentially the historic mine rock stockpiles. Only non-acid generating mine rock will be used for construction.

## 3.0 HYDROGEOLOGICAL SETTING

### 3.1 Physical Setting

The project study area is located in the Wawa Sub-province of the Canadian Shield. The landscape at Site generally consists of ridges surrounded by low-lying areas which are dominated by lakes, stream, and wetlands (Roberston GeoConsultants, 2017). Local ground surface elevations (i.e. topography) near Site infrastructure range from approximately 480 masl at the high-point within the planned TMF to 390 masl near Spring Lake. The average annual precipitation for data gathered from the Magino Climate station for October 2011 to March 2016 was 764 mm, with mean daily temperatures ranging from -17 °C in February to 17 °C in August (SLR, 2016a).

Existing surface water features at Site, depicted in Figure 2, include numerous native lakes, ponds, and creeks, as well as an existing tailings facility pond. Surface water features are generally expected to act as either sources (i.e. losing) or sinks (i.e. gaining) to groundwater flow depending on local conditions. Streams in low-lying areas, which most features at Site represent, are typically expected to act as sinks.) Mean monthly flows from 2011 to 2016 for stations installed near Site generally had a wide range of values, with low-flows (likely representing 'base-flow' conditions) often less than 1 L/s, indicating that groundwater contributions to small creeks are likely limited (SLR, 2016a). Instantaneous flows in McVeigh Creek ranged from 10,289 L/s (May 2013 spring melt) to 0.46 L/s (July 2012). Surficial geology in the project area, depicted in Figure 3, consists of organics, colluvium, glaciofluvial sediments, and glacial till. Overburden thickness is typically approximately 2-3 m of thickness and mostly consists of glacial till (hydraulic conductivity of approximately  $5 \times 10^{-6}$  m/s) but is as much as 16 m in the area near the proposed Open Pit, where glaciofluvial sediments (hydraulic conductivity of approximately  $3 \times 10^{-4}$  m/s) are predominant (SLR, 2016b; Robertson GeoConsultants, 2017).

Permeability of the bedrock is controlled by localized fracturing and potentially by larger scale structures (i.e. faults). Hydraulic conductivity values from tests conducted in the upper 60 m were highly variable

( $<10^{-8}$  to  $>10^{-4}$  m/s with a geometric average of approximately  $8 \times 10^{-7}$  m/s). Hydraulic conductivities generally decrease with depth (SLR, 2016b; Robertson GeoConsultants, 2017).

Two underground mines are located near the proposed Magino Open Pit Site:

- 1) Historic Magino Underground Mine Workings, which was mined from 1987 to 1992 and is now flooded. A mine dewatering test was conducted between July 1 and August, 2014 to assess the response of the local groundwater system to dewatering. During this test, the mine was pumped at 2,742 m<sup>3</sup>/day for 48 days, then 1,830 m<sup>3</sup>/day for 7 days. Drawdowns measured in the mine shaft during this test reached approximately 13 m after 48 days of pumping. The largest groundwater well drawdown resulting from dewatering was observed in GT12-11 (approximately 11 m); and
- 2) Richmont Underground Mine, which is located approximately 1.5 km northeast of the proposed Magino Open Pit (i.e. beneath Goudreau Lake) and is dewatered at approximately 1730 m<sup>3</sup>/day based on records from 2010 to 2011 (Robertson GeoConsultants, 2017).

### **3.1.1 Expected Changes during Construction/Operations**

Construction activities primarily interact with the water table during excavation for foundations, resulting in localized depression of the groundwater surface at these locations. These excavations are usually constructed to either competent overburden material or the top of bedrock. For this site, bedrock generally occurs within 2 or 3 m of groundwater surface, which limits the amount of drawdown to minimal changes. No significant long-term changes in groundwater conditions are expected during most of the foundation excavations.

Several changes to the local physical setting are expected based on the current mine design during operations. Surface infrastructure associated with the new mine development are depicted in Figure 1. Those relevant to the Site hydrogeological setting include:

- 1) *Open Pit Development*: The development and dewatering of the Open Pit will create a sink to the local groundwater system. The predicted inflow to the Open Pit at the End of Mine Life (i.e. Year 12) is approximately 6,117 m<sup>3</sup>/day (Robertson GeoConsultants, 2017). The historical Magino Underground Mine Workings and ground which formerly contained the mine's above ground infrastructure will be 'mined-out' as part of the Open Pit development.
- 2) *Surface Water Features*: Several natural features will be displaced/offset as part of the mine development. These changes are summarized in Figure 2. Several surface water management ponds and ditches, depicted in Figure 1, will be constructed as part of the mine development (e.g. a perimeter drainage collection ditch, detention ponds, etc.).
- 3) *Mine Site Surface Infrastructure*: The site surface topography will be altered by the construction of the TMF/MRMF, several perimeter stockpiles, Mill Area, and Crusher (Figure 1). Groundwater will tend to mound within these facilities, depending on the permeability of the material contained within.

## **3.2 Groundwater Flow Regimes**

Figure 4 shows groundwater levels in meters above sea level (masl) and inferred groundwater flow directions observed in existing monitoring wells in October 2013.

Piezometric levels are generally a subdued version of the underlying (lower permeability) bedrock topography with groundwater generally flowing from topographic highs in the centre portion of the project area towards lower elevations and surface water bodies in the southwest (Lovell, Webb and Goudreau Lakes), south (Spring Lake) and northwest (Waterbodies 9, 8, and 7).

Horizontal gradients are typically greater in areas of high topographic relief than in areas of low relief. Very low horizontal gradients are observed in the areas with glaciofluvial sediments due to the presence of the high K sediments and underlying historic mine workings, which act as a local zone with relatively higher K compared to the low permeability undisturbed bedrock.

Upward vertical gradients were observed in March 2013 in several wells in lower lying areas, indicating that groundwater likely discharges towards those local surface water bodies. In contrast, the largest downward vertical gradient (0.16 m/m) on Site was noted at the north shore of Goudreau lake, which is likely caused by depressurized underground workings in the vicinity of that well.

Additional discussion of Site-specific data are provided in Section 4.2.

## 4.0 GROUNDWATER MONITORING

### 4.1 Monitoring Goals and Objectives

The overall goal of this groundwater monitoring is to provide an early indication of seepage migration to sensitive surface water receptors and potential offsite migration of mine-site derived seepage. The objectives of groundwater monitoring are to:

- 1) Monitor changes in the hydraulic regime of subsurface flow near potential receptors due to above ground mine site construction/operations (open pit dewatering monitoring will be addressed separately);
- 2) Conform that only minor groundwater quality changes from baseline conditions occur during mine development; and
- 3) Identify areas where additional mitigation controls (e.g. recovery wells) might be needed based on flow and water quality observations.

### 4.2 Summary of existing groundwater level monitoring data

Monthly monitoring of groundwater levels was conducted from the period of September 2012 through March 2014 by Argonaut personnel. A summary of groundwater level measurements from October 2013 and January 2014 is provided in Attachment 1. It can be noted that groundwater levels measured in monitoring wells screened in overburden range from 0 to 2 mbgs indicating that the overburden is mostly saturated with the water table close to surface, which is typical of environments where either gradients are low (e.g. often at wetlands) or the materials of low hydraulic conductivity. Bedrock groundwater monitoring data also show, in general, that hydraulic heads within 1 to 3 m, or at the surface, even in areas of notable topographic highs, which is an indication of low permeability of the bedrock. The greatest depth below ground surface (approximately 15 to 20 m) was measured in MW/HYD 13-14 and MW/HYD 13-16, located on the north shore of Goudreau Lake on the Richmont Mine Site Property. This localized depression in the groundwater levels is considered to be related to the underground workings at the Richmont Mine Site and the influences on the shallow bedrock aquifer is likely limited to the immediate vicinity of the workings.

Figures 5 and 6 show typical seasonal variations in groundwater levels in four selected monitoring wells, which were located within and in proximity of the MRMF footprint, and not affected by pumping from the

Magino underground workings. Maximum seasonal variations in groundwater levels vary from less than 0.5 m in low-lying areas, which may be controlled by larger surface water bodies, to more than 2 m in higher elevation area e.g. at HYD-12-02A, where drainage would be limited by the low permeability of the bedrock. In general, groundwater level increases at the end of spring freshet (May-June) and during the early fall (September-October) in response to heavy precipitation. During the winter month, groundwater levels gradually decreases due to the lack of recharge.

### 4.3 Summary of existing groundwater quality data

Groundwater quality was monitored in 28 groundwater wells located in the project area. A summary for the groundwater quality monitoring wells is provided in Attachment 2. These wells provided groundwater quality data for the overburden, shallow bedrock (upper 60 m), and deep bedrock. Locations of these monitoring wells were identified in Figure 7, grouped by layers in different color. When analyzing, these wells were further subdivided into three groups given their locations relative to proposed mine infrastructure: TMF, MRMF and Open Pit. Groundwater quality at the Open pit footprint is potentially impacted by historical mining activities.

Groundwater at the existing mine site is not used as a source of drinking water. Groundwater quality data were compared to Provincial Water Quality Objectives (PWQO) and Ontario Drinking Water Quality Standards (ODWQS) to provide a frame of reference. (It should be noted that PWQO is typically not used for evaluating groundwater quality due to the frequent occurrence of higher metal concentrations in groundwater, which is more prone to having reducing conditions than surface water). Table 1 provides a summary of the groundwater sampling results in terms of parameters that exceeded ODWQS or PWQO limits. A summary for the full parameters is provided in Attachment 3.

Overall, groundwater quality sampling results indicate that the groundwater in the project area is of good quality. (Note that the high concentrations of total metal concentrations compared to dissolved concentrations are assumed to be due to the digestive of sediment by acid either as preservatives the sample bottles or by the lab, and only the dissolved metal concentrations are discussed here). The groundwater quality improves with depth. More specific findings were summarized below:

- Several ODWQS and PWQO parameters were exceeded from the overburden zone down to deep bedrock including Dissolved Organic Carbon (DOC), and three dissolved metals (iron, manganese and silver). Exceedances of iron and manganese were both detected throughout the site, but with higher concentrations near the area of previous mining activities, while no exceedance of silver was observed in this area.
- Limits of cyanide, cadmium, chromium, copper and nickel were only exceeded in the overburden zone and only in a few wells. Slight exceedances of nickel and copper were only observed in MW09-02, which is located in the area of previous mining activities on the north shore of Webb Lake. In wells HYD-12-02B, HYD-03B and HYD-12-04B, located to the west of the historical mine site, cyanide was reported as slightly above the PWQO limit but within the ODWQS in one out of several sampling events, which given that cyanide is generally not a naturally occurring compound and location, is likely due to analytical error more than due to contamination.
- Two wells exhibited slightly elevated values of sulphate (SO<sub>4</sub>) at 99 mg/L for MW09-02 and 138 mg/L for HYD-12-05B. MW09-02 is located in the area of previous mining activities by Webb Lake with exposed bedrock and residual ore, while HYD-05A is located in shallow bedrock by Spring lake. The elevated sulphate is considered to be the result of the mineralization of the rock in the area (Prodigy Gold Incorporation, 2017) or in the case of MW12-09 residual ore. There is no water quality standard assigned by ODWQS or PWQO for sulphate; however, it should be noted that even for the highest sulphate level in HYD-05B, it was still considered to be relatively low.

## 4.4 Monitoring Locations

Existing and proposed groundwater monitoring stations at Site are depicted in Figure 8. Many of the existing groundwater monitoring stations are expected to be affected by the construction of mine site infrastructure or the Open Pit; however, several are likely to be unaffected (e.g. HYD12-12A/B), and can be utilized for future monitoring. Additional proposed monitoring wells ('MW20' series in Figure 8) are emplaced based on the locations of potential sources (e.g. TMF Supernatant Pond) and potential receptors (e.g. Unnamed Water Body 9). The main potential sources of groundwater quality changes have each been given multiple monitoring wells (up to 13 for the TMF/MRMF), with each main potential receptor having at least one monitoring well. This was thought sufficient to for a monitoring well network to identify trends in groundwater quality changes created by features as larges at the TMF/MRMF.

Results from hydraulic conductivity testing conducted at site indicate that the upper 60 m of bedrock tends to have the highest hydraulic conductivity for bedrock (Robertson GeoConsultants, 2017). As such, monitoring wells should generally be installed as open hole wells cased to competent bedrock and installed to a maximum depth of 60m. In addition, twined/nested screened monitoring well installations should be made where overburden aquifers are encountered during drilling. These screened installations will be more likely in the southeastern area of site (i.e. near the Open Pit), where glaciofluvial sediments dominate the surficial geology (as opposed to the central, northwestern section of Site, where glacial till and bedrock outcrops tend to dominate the surficial geology). A description of the proposed MW20-series installations is given in Table 2.

A summary of existing groundwater monitoring wells that are not expected to be affected by mine construction is provided in Table 3. Groundwater sampling can be conducted from standard monitoring wells, but not from vibrating wire piezometers.

## 4.5 Methods

Sampling will be performed to industry standards and in accordance with protocols established by the MOE (1996). Initial monitoring which defines the baseline or background chemical properties of groundwater needs to be established before any mining activities (typically requires at least 12 months).

- The total depth and depth to the water level should be measured using a calibrated water level meter.
- During well purging, measurements of field parameters (pH, temperature, and conductivity) will be made, and purging will continue until the field parameters stabilize to within  $\pm 10\%$  of the last measurement. If the monitoring well goes dry prior to sampling, the wells will be allowed to recover, and then purged a second time, and following recovery the sample will then be collected. Alternatively, low flow sampling techniques can be considered.
- Collections of groundwater sample will be performed following the purging of each bore. Field measurements of the final samples will be made for temperature, pH, conductivity and alkalinity. All wells are sampled directly into laboratory supplied containers, only samples for metals analysis are field filtered.

### 4.5.1 Frequency

Groundwater sampling will be conducted three times a year (i.e. quarterly events, excluding the frozen winter months) during the first five years, then on annual basis thereafter.

### 4.5.2 Parameters

Groundwater quality sampling parameters are listed in Table 6.

## 4.6 Trigger Criteria

If three consecutive final groundwater sampling results show a clear trend of increasing concentrations of metals or major anions above historical levels, then further investigation will be triggered.

## 4.7 Mitigation and Contingency Measures

The requirement for and implementation of additional mitigation measures (i.e. beyond those included as part of the mine infrastructure design) will be informed by the results of water quality and water level monitoring and subsequent evaluation of the trigger criteria. The primary control measure will be remedial pumping wells. Installation parameters of remedial pumping wells (i.e. location, target depth/unit, expected pumping level/rate) will be governed by: the inferred flow pathway from the source, the positions of nearby receptor(s), hydrostratigraphy based on nearby borehole information, and monitoring data.

Note, the current mine design includes a dug ditch collection system as well as shallow subsurface underdrains and grout walls that surround the perimeter of the TMF/MRMF. It is expected that these features will be effective at intercepting seepage from the TMF/MRMR (Robertson GeoConsultants, 2017). Furthermore, the water quality may not be expected to be poor considering the low possibilities of acid rock drainage (ARD) and low degree of chemical weathering on the site.

## 4.8 Data Analysis and Reporting

Monitoring data will be compiled, reviewed, and submitted to the MECP on an annual basis.

**Table 4: Proposed MW20-series Monitoring Well Installations**

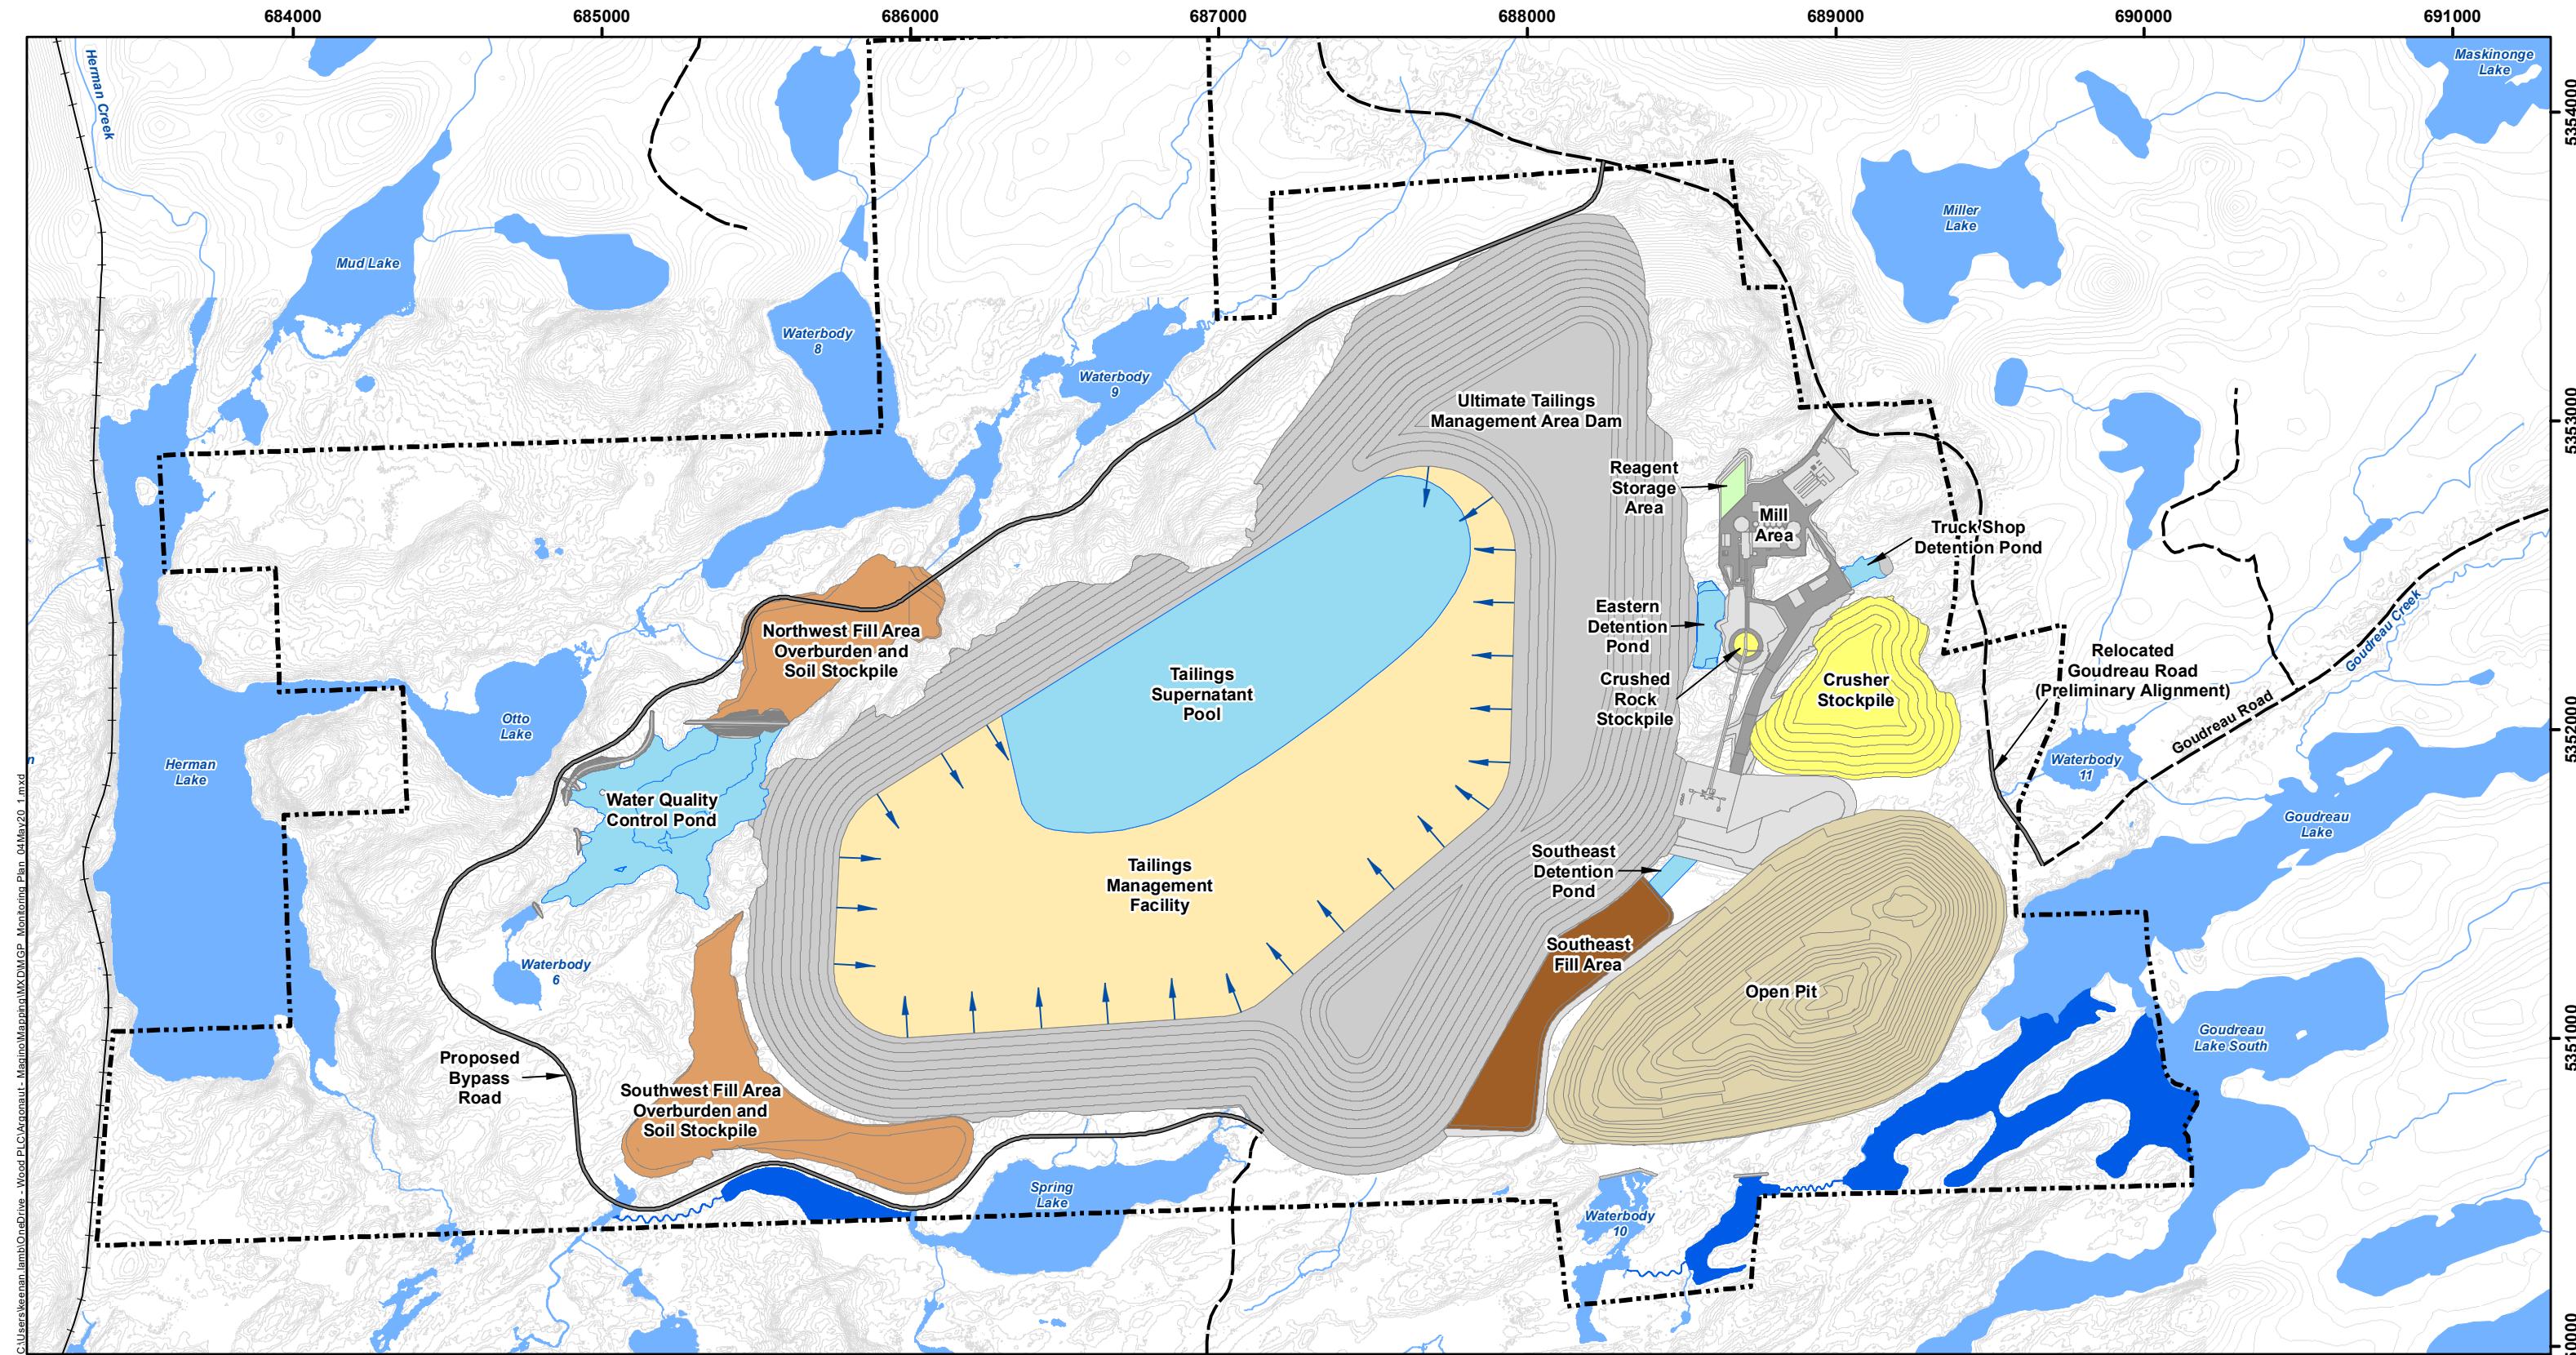

Monitoring Well ID	Justification
MW20-1	Near the Crusher Pad
MW20-2	Near the Mill Area
MW20-3	Downgradient of Mill Area
MW20-4	Downgradient of TMF/MRMF. Upgradient of Miler Lake
MW20-5	Downgradient of TMF/MRMF. Upgradient of Waterbody 8/9.
MW20-6	Downgradient of TMF/MRMF. Upgradient of Waterbody 9.
MW20-7	Downgradient of TMF/MRMF. Upgradient of tributary to Waterbody 9.
MW20-8	Downgradient of Water Quality Control Pond. Upgradient of Otto Lake.
MW20-9	Downgradient of TMF/MRMF. Upgradient of Waterbody 6.
MW20-10	Downgradient of TMF/MRMF and NW Fill Area. Upgradient of Waterbody 9.
MW20-11	Downgradient of TMF/MRMF. Upgradient of tributary to Waterbody 9.
MW20-12	Downgradient of TMF/MRMF. Upgradient of Spring Lake.
MW20-13	Downgradient of TMF/MRMF. Upgradient of Waterbody 6.
MW20-14	Near the Crusher Pad
MW20-15	Downgradient of TMF/MRMF. Upgradient of McVeigh Creek.
MW20-16	Downgradient of TMF/MRMF. Near Spring Lake.
MW20-17	Downgradient of TMF/MRMF.
MW20-18	Downgradient of Mill Area

**Table 5: Existing Groundwater Monitoring Stations Likely to be Unaffected by Mine Construction**

Monitoring Well ID	Installation Type	Unit	Description
HYD-12-12A/B	Twinned Monitoring Wells	Bedrock	Downgradient of TMF/MRMF. Upgradient of Waterbody 8
GEO/HYD13-03	Monitoring Well	Unknown	Downgradient of TMF/MRMF. Upgradient of Water Quality Control Pond
HYD-12-06A/B	Twinned Monitoring Wells	Bedrock	Downgradient of TMF/MRMF. Upgradient of Spring Lake
HYD-12-11A/B	Twinned Monitoring Wells	Bedrock / Overburden	Downgradient of TMF/MRMF. Near Crusher Pad. Upgradient of Open Pit.
Mw/HYD13-14a/b/c	Vibrating Wire Piezometers (3)	Bedrock	Near Open Pit. Adjacent to Goudreau Lake
MW/HYD13-16	Monitoring Well	Bedrock	Near Open Pit. Adjacent to Goudreau Lake

**Table 6: Groundwater Analytical Parameters.**

Field Measurements	Water level, temperature, pH, conductivity, alkalinity
<b>Dissolved Metals</b>	Aluminum (Al), Antimony (Sb), Arsenic (As), Barium (Ba), Beryllium (Be), Bismuth (Bi), Boron (B), Cadmium (Cd), Chromium (Cr), Cobalt (Co), Copper (Cu), Iron (Fe), Lead (Pb), Lithium (Li), Magnesium (Mg), Manganese (Mn), Molybdenum (Mo), Nickel (Ni), Silver (Ag), Strontium (Sr), Thallium (Tl), Tin (Sn), Titanium (Ti), Tungsten (W), Uranium (U), Vanadium (V), Zinc (Zn), Zirconium (Zr)
<b>Major Anions</b>	Sulphate (SO <sub>4</sub> ), Cyanide (CN), Chloride (Cl), Carbonate (CO <sub>3</sub> )
<b>Major Cations</b>	Calcium (Ca), Potassium (K), Sodium (Na),
<b>Others</b>	Dissolved organic carbon, phosphorus

## **Attachment 1**

### **Groundwater Piezometric Monitoring Data from 2012 to 2014**

## **Appendix D-1 - Piezometric Level Monitoring**

## Notes:

UTM Coordinates are NAD83, Zone 16.

m - metres

m-amsl - metres above mean sea level.

m-agrs - metres above ground surface

m-agrs - metres above ground surface  
m-bts - metres below top of stickup

m-bts - metres below top of stickup.  
m-bgs - metres below ground surface

mbgs - metres below ground surface.

NA - Not Available.

Elevations based on UTM coordinates being plotted over LIDAR survey; accuracy is limited.  
\*M = Mather, L = Ladd, S = Sibley (with CW = Cullinan Waterfall).

\*Monthly through March 2014, quarterly (with GW sampling events, thereafter)

## **Appendix D-1 - Piezometric Level Monitoring**

#### **Notes:**

UTM Coordinates are NAD83, Zone 16.

m - metres

m-amsl - metres above mean sea level.

m-a.s.l - metres above mean sea level  
m-a.g.s - metres above ground surface

m-ags - metres above ground surface  
m-bts - metres below top of stickup

m-bts - metres below top of stickup:  
m-bgs - metres below ground surface

NA - Not Available

NA - Not Available.

Elevations based on UTM coordinates being plotted over LiDAR survey points. The survey points are plotted with SW coordinates.

						Nov-12	Feb-13	Jun-13	Aug-13	Nov-13	Nov-12	Feb-13	May-13	Aug-13	Nov-13		
Conductivity	umhos/cm	3	-	-	-			-	346	335			377	427	390		
Hardness (as CaCO <sub>3</sub> )	mg/L	10	-	-	-			155	-			197	-				
pH	pH units	0.1	-	6.5-8.5	6.5-8.5			8.12	8.2	8.01		7.71	7.94	7.84			
Total Dissolved Solids	mg/L	10	-	500	-			200	195	218		246	254	237			
Alkalinity, Bicarbonate (as CaCO <sub>3</sub> )	mg/L CaCO <sub>3</sub>	5 or 10	-	-	-			169	173	187		206	217	219			
Alkalinity, Carbonate (as CaCO <sub>3</sub> )	mg/L CaCO <sub>3</sub>	5 or 10	-	-	-			<10	<5.0	<10		<10	<10	<10			
Alkalinity, Hydroxide (as CaCO <sub>3</sub> )	mg/L CaCO <sub>3</sub>	5 or 10	-	-	-			<10	<5.0	<10		<10	<10	<10			
Alkalinity, Total (as CaCO <sub>3</sub> )	mg/L CaCO <sub>3</sub>	5 or 10	-	30-500	-			171	173	189		207	218	220			
Ammonia, Total (as N)	mg/L	0.02	-	-	0.02			0.162	0.151	0.170		0.093	0.062	0.056			
Bromide (Br)	mg/L	0.1	-	-	-			-	<0.10	<0.10		-	-	<0.10			
Chloride	mg/L	0.1 or 2	-	-	-			3.4	3.97	4.17		4.5	4.3	4.40			
Computed Conductivity	uS/cm	n/a	-	-	-			-	-			380	-				
Conductivity % Difference	%	n/a	-	-	-			-	-			0.8	-				
Fluoride (F)	mg/L	0.03	-	1.5	-			-	<0.15	0.160		-	-	0.057			
Ion Balance	%	n/a	-	-	-			-	-			118	-				
Nitrate (as N)	mg/L	0.03 or 0.1	-	10	-			<0.10	<0.15	<0.030		<0.10	<0.10	<0.030			
Nitrite-N	mg/L	0.02 or 0.1	-	1	-			<0.10	<0.10	<0.020		<0.10	<0.10	<0.020			
Saturation pH	pH	n/a	-	-	-			-	-			7.27	-				
Phosphate-P (ortho)	mg/L	0.003	-	-	-			-	<0.0030 *	<0.0030		-	-	<0.0030			
Phosphorus (P)-Total Dissolved	mg/L	0.005 or 0.03	-	-	-			<0.030	<0.0050	<0.0050		<0.030	<0.030	<0.0050			
Total Phosphorus	mg/L	0.003	-	-	-			-	0.0049	<0.0030		-	-	0.0087			
Phosphorus, Total	mg/L	0.03	-	-	0.01-0.03			0.045	-			0.065	0.03				
TDS (Calculated)	mg/L	n/a	-	-	-			-	-			232	-				
Sulfate (SO <sub>4</sub> )	mg/L	0.3	-	-	-			-	7.8	7.79		-	-	9.92			
Sulphate	mg/L	2	-	500	-			11	-			14.8	10.2				
Anion Sum	me/L	n/a	-	-	-			-	-			3.85	-				
Cation Sum	me/L	n/a	-	-	-			-	-			4.54	-				
Cation - Anion Balance	%	n/a	-	-	-			-	-			8.2	-				
Cyanide, Weak Acid Diss	mg/L	0.002	-	-	-			-	<0.0020	<0.0020		-	-	<0.0020	<0.0020		
Cyanide, Total	mg/L	0.002	-	0.2	0.005	<0.002	<0.002	<0.0020	<0.0020	<0.0020	<0.002	<0.002	<0.0020	<0.0020	<0.0020		
Dissolved Organic Carbon	mg/L	1	-	5	-			3.8	3.5	4.9		2.6	2.5	4.1			
Total Organic Carbon	mg/L	1	-	-	-			4	3.5	4.1		2.9	2.7	2.8
